STATE OF ARKANSAS

Fourteenth Biennial Report of the

ARKANSAS STATE HIGHWAY COMMISSION

For the Period From July 1, 1938, to June 30, 1940

LETTER OF TRANSMITTAL

To the Governor and the General Assembly of the State of Arkansas:

In accordance with the provisions of Act No. 320 of the Acts of 1913, amended by Act No. 7 of the Acts of 1921, there is presented herewith the Fourteenth Biennial Report of the Arkansas State Highway Commission for the fiscal years 1939 and 1940.

This report presents in narrative as well as statistical form pertinent information relative to the maintenance and construction activities for the period indicated and will, it is hoped, convey in a satisfactory manner all necessary information for a proper understanding of the status of the department as well as the state highway system as of the date of the report.

Respectfully submitted,

PAUL W. SHERIDAN, Chairman
DR. H. E. MOBLEY, Vice-Chairman
GEORGE APPLEBY
HUGH B. BENTON
J. H. MYERS
A. G. PATTESON
JOHN H. VOGEL
Members, State Highway
Commission

INTRODUCTION

The purpose of this publication is to report the administration of highway affairs as exercised by the State Highway Commission, under authority granted by statute, during the biennium ending June 30, 1940. The report conveys in narrative, statistical, and pictorial form what has been done during that period toward the improvement of a system of highways which will more adequately serve the needs of the State for highway transportation service. Each phase of highway activity has been presented and discussed in an attempt to portray not only the accomplishments of this biennium, but also to indicate the present status of the highway situation in Arkansas.

HIGHWAY FUNCTION

The function of a highway system is to provide suitable and adequate travel facilities for the safe and efficient movement of the traffic generated by or attracted to the area within which it lies. This is a constantly changing function, never static, never complete. It varies with each change in the economic, social, recreational or governmental interests and activities of the area and is vitally affected by all changes in types and methods of transportation.

The Highway Function is to Provide Adequate Travel Facilities.

Originally all activities relating to public roads in Arkansas were administered by local governments. The advent of the automobile, however, increased the burden of providing highway facilities beyond the capacity of the local governments, and some form of State assistance and control over a connected system of roads became essential. The State Highway Department created by the legislature of 1913 was at first only a supervising and coordinating agency, while local governments continued to exercise administrative and jurisdictional authority. During the twenty-seven years since the creation of the first State Highway Commission the concept of its functions and duties has

changed materially so that instead of a mere advisory agency, the Commission through the Highway Department, now exercises full control of all operations incident to the construction, maintenance, and issuance of rules and regulations governing the use of a designated system of State Highways comprising more than 9,200 miles.

ADMINISTRATION

State Highway Commission—State highway affairs in Arkansas are administered through a commission of seven members who are appointed for a two-year term by the governor with the advice and consent of the State Senate. The State Highway Commission is vested with all powers and duties specified and imposed by law for the administration of the State Highway Department, together with all powers necessary or proper to enable the Commission or any of its officers or employees to carry out fully and effectively the regulations and laws relating to State highways.

Director of Highways—The chief executive officer of the State Highway Department is the Director of Highways, who, subject to the approval of the governor, has direct and full control and management of the affairs relating to the State Highways, subject only to the powers of the Commission as set forth by law.

Assistant Director and Secretary—The Director of Highways is empowered to appoint an assistant who shall serve as Secretary of the State Highway Commission, have general charge of the office, superintend the clerical business and perform such other duties as may be delegated to him.

Chief Engineer—The Chief Engineer who is selected by the Director of Highways is the principal technical officer of the Department and is responsible for all engineering activities.

Department Divisions

In addition to the administrative officers previously mentioned there are in the Department various divisions directly responsible for definite phases of highway activity.

Construction—General administrative control of all road and bridge construction activities including the preliminary work of surveys and plans is exercised directly through the central office. These operations are directed by the Construction Engineer, Bridge Engineer and Engineer of Plans and Surveys.

Federal Aid Procedure—The function of this division is that of coordinator between the Public Road Administration and the State Highway Department. All correspondence with the Public Roads Administration, contracts between the two governmental agencies, reimbursement vouchers and reports are handled through the Office Engineer of Federal Aid Procedure.

Materials and Tests—The activities of the division of materials and tests are divided into three principal classifications as follows: preliminary field investigation, laboratory testing, and field inspection and testing. All work is under the supervision of the Engineer, Materials and Tests.

Maintenance—One of the major responsibilities of the State Highway Department is that of preserving the physical condition and maintaining the usefulness of the highways. The control of maintenance operations is effected through ten maintenance districts, each of which maintains its own office, shop and requisite personnel. Each district is administered by a district engineer who is directly responsible to the maintenance engineer located in the central office.

Traffic and Safety—This division, which is administered by the Traffic Supervisor, is charged with the responsibility of developing and furthering a State-wide program of highway safety and furnishing the public with information concerning the conditions of Arkansas highways.

Statistics and Analyses—The function of this division is to gather, assemble and disseminate factual information relative to highway affairs which will present to the Highway Administration and other interested groups a current and complete picture of the highway situation in Arkansas.

Accounting—This division is charged with the control and proper recording of the department's expenditures, and is supervised by the chief accountant.

Purchasing—Centralized control of the procurement of supplies and equipment is maintained through the Purchasing Agent. This system assures uniform prices and continuous account control on the large volume of purchases made by the department.

Equipment—The servicing, repair and replacement of equipment is the responsibility of the Equipment Supervisor. Maintenance of equipment is provided through a central and ten district shops.

Legal—The legal division, under the direction of the Highway Attorney, handles all judicial problems which arise in connection with administration of State highway affairs.

Traffic Rates—The Freight Traffic Manager audits all freight claims, supervises the routing of shipments, and represents the department at hearings before the Arkansas Corporation Commission.

GOVERNMENTAL RELATIONSHIPS

Within recent years the scope of the responsibilities and duties of the State Highway Department has increased immeasurably. In order to provide the maximum traffic service facilities and the greatest possible protection to the public, it has been necessary that close relationships be maintained with various Federal, State and Local governmental agencies.

Federal Government

Public Roads Administration—The most important relationships with any governmental agency are those with the Public Roads Administration, since, in reality, the State Highway Department acts as the agent of the Administration in all matters relating to Federal Aid highways in Arkansas. These relationships have become increasingly important in view of the fact that no State funds have been available for highway construction since 1934. Construction since that time has been limited to the Federal Aid Highway System, because the annual appropriation offered by the Federal Government through the Public Roads Administration is restricted to use on the Federal Aid highways of the State.

Every construction program prepared by the Highway Commission involving the use of Federal Aid funds must be approved by the Public Roads Administration before it is initiated. Furthermore, specific approval of the plans and specifications and a separate contract is required for each individual project of the program.

Work Projects Administration—Under rules and regulations prescribed for the Work Projects Administration, the State Highway Department has initiated and sponsored a number of cooperative highway projects with this agency during the biennium. It has been impossible for the Highway Department to take full advantage of the Federal work relief program because the State has been without the necessary funds to sponsor construction projects. This has limited the cooperative work with this agency to projects involving maintenance and betterment which could be financed from the Highway Maintenance Fund. During the biennial period more than forty projects of this type have been initiated or approved involving work in thirty-one counties.

U. S. Geological Survey—During the biennium the Highway Department entered into a cooperative agreement with the United States Geological Survey for investigation of surface water resources of the State. Through this work data are obtained relative to high and low water elevations and stream flow which are necessary in road and bridge construction.

State Departments

The authority of the State Highway Commission is limited to the operations incident to the construction and maintenance of highways and to the issuance of rules and regulations governing their use. The enforcement of rules and regulations and the collection of all income for highway purposes is delegated to the State Police and the State Revenue Department, respectively. This necessarily requires that relationships be maintained with these departments regarding matters of public safety and highway finance.

Much statistical information regularly required by the Public Roads Administration must be obtained from the Revenue Department. The Division of Statistics and Analyses acts as a clearing house for the Department in the continual exchange of information with other State officials and agencies.

Through cooperation with the State Geological Department and the State-wide Mineral Survey much valuable information has been obtained regarding the location and extent of deposits of road materials throughout the State.

Relations With Counties

The county courts of Arkansas have constitutional jurisdiction over all public roads and right of ways and under existing laws the Highway Commission is required to call upon the County Court to provide the necessary right of way for each highway project. The Right of Way Engineer and the Legal Division work in close cooperation with the various county judges in such matters.

The passage of the Hayden-Cartwright Federal Road Act of 1936 brought about new relationships between the counties and the Department. This act provided Federal Aid funds for the construction of secondary or feeder roads which are not on nor potential additions to the Federal Aid system, including for the first time construction on county roads. The Highway Department supervises the construction of secondary roads located on the county road system and executes the necessary maintenance agreement with the county judge for each project.

Other routine relations include obtaining annual statistical data regarding county

road construction and finance.

Relationships With Municipalities

Relations between the Department and cities and towns are primarily those concerned with securing the necessary ordinances dedicating for road purposes the land required for right of way. In cities having a population of 2500 or more inhabitants a maintenance agreement is obtained on each highway construction project. The Department cooperates with the various Chamber of Commerce organizations in distributing information regarding cities which offer unusual recreational and scenic attractions.

Public Relations

In addition to the relations maintained with other governmental units and agencies, the State Highway Department has during the biennium sought a wider and safer use of

State highways through intelligent relationships with the public.

The public is kept fully informed of the condition of the highways of the State by means of the road condition report released weekly through the Traffic and Safety Division to the press and which is mailed to more than four hundred tourist and travel information agencies throughout the United States and Canada. In addition, special press releases are made outlining tours in specific sections of the State which are of outstanding scenic interest, or offer unusual seasonal tourist attraction. The Department also cooperates with the State Publicity Department in distributing information regarding tourist attractions in the State. The official map of the State highway system published by the Commission in four editions each year, offers information not only about the State highway system, but also lists the State Parks and other points of interest for tourists. The map is also illustrated with numerous seasonal scenes. As a regular feature of the safety educational program of the Department two radio broadcasts are made each week. Such programs are varied to include safety forums, roundtable discussions and explanations of traffic rules and regulations.

SUMMARY OF BIENNIUM

Conditions and Problems

While the State highway system during the period covered by this report has attained the highest degree of completion in its history, it at the same time has been subjected to the severest use. Motor vehicle registrations during 1938 were 231,070 while the registrations in 1939 were 252,681 or an increase of 21,611 vehicles in use over the previous year. Studies of traffic and road use that were made by the Division of Statistics and Analyses reflect an increase in traffic of from 40 to 45 per cent on the State highway system as a whole, during the past five years.

The density, speeds and loadings that the system is being called upon to handle is increasing the deterioration of surfacing on hundreds of miles of roads and on many of the older bridges at an alarming rate. This destruction in the face of the complete absence of State funds for other than maintenance operations has resulted in an acute situation. The roads year by year are deterioriating more rapidly than renewals or replacements can be made on the basis of present financing with the result that the State's investment in its highway system is being dissipated. This condition applies not only to the roads but to the equipment as well. Here also replacements have failed to keep pace with obsolescence and deterioration because of the lack of funds.

Three cardinal elements are necessary in any satisfactory maintenance or construction operation. These are MONEY, MATERIALS and LABOR. It is axiomatic that a shortage in any one unbalances the other.

The inevitable conclusion, therefore, is that the only way whereby renewals and replacements can be made so as to satisfy the day by day requirements of the highway

user as well as the protection of the State's investment in its roads is by means of adequate financing. This fact, in turn, operates to emphasize the need of financing on a basis more liberal than is possible under the legislation that now governs this department's operations.

It is hoped, therefore, that the forthcoming session of the general assembly will find the means of solving this problem.

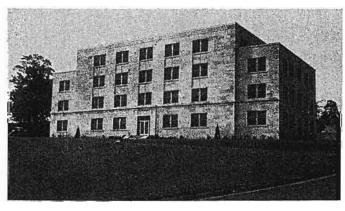

Accomplishments

Status—Table No. 20, Section VI, shows that since the publication of the thirteenth biennial report 158 contracts have been awarded for the construction of road, bridge and grade-crossing protection projects using Federal Funds, and that seven maintenance contracts involving State Funds were awarded for a total of 165 jobs. The following table reflects the status of the State Highway System as of December 1, 1940 as compared with December 1, 1938. The tabulation includes improvements that have been completed or that are in process of completion. Further information concerning the location, type, dollar value, and counties benefited, will be found in the Appendix, Section VI. Exhibit No. 1 indicates the status of highway improvements in 1940 as compared with 1930.

Status of State Highway System, Mileage by Types

	Miles	Miles
Type	Dec. 1, 1938	Dec. 1, 1940
Concrete pavement	1,200.39	1,242.7
Asphaltic pavement	489.84	486.8
Bituminous surfacing	1,074.03	1,357.1
Gravel		5,575.8
Graded	718 <i>.</i> 31	465.4
·Unimproved		161.5
Sub total Through incorporated places over 2,500 population	9,143.82	9,289.3
(unclassified)	181.84	179.7
Total	9,325.66	9,469.0

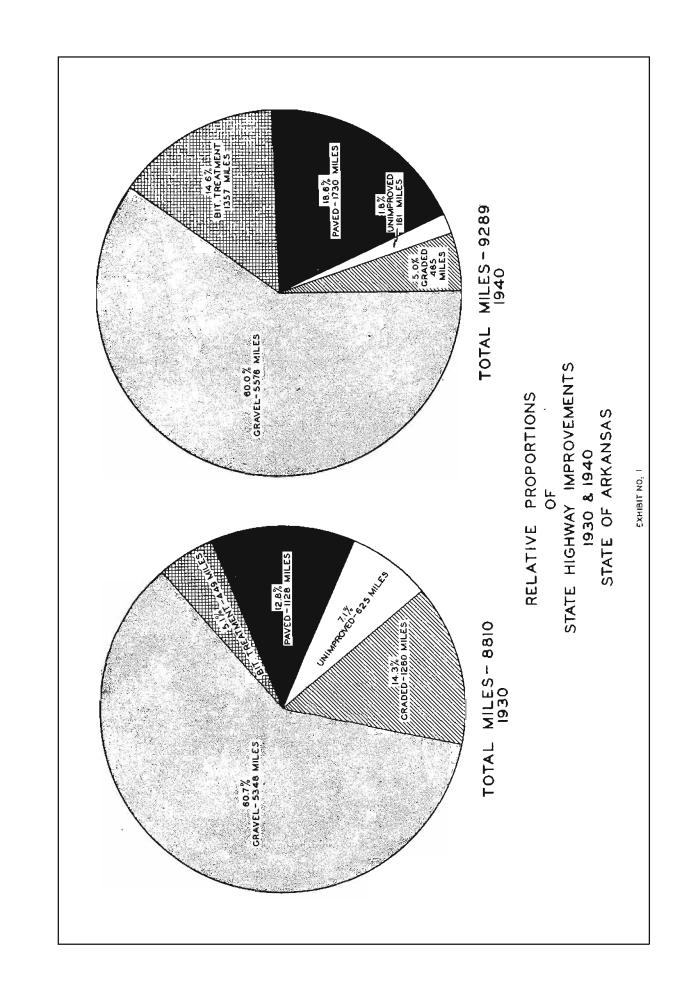

Buildings and Grounds—During the biennium a modern fireproof, four-story, stone veneer office building has been constructed on the West side of the Capitol grounds at a cost of \$100,000, forty-five percent of which was a grant from the Federal Public Works Administration. All departments of the central office staff are now housed under one roof. This has eliminated the necessity of renting outside space and has also increased very materially the dispatch and efficiency with which the department's operations are carried out. This building was designed and constructed so as to afford space and facilities for the efficient operation of all divisions.

Highway Building

In addition, a modern threestory, fireproof vault has been erected, in cooperation with the Work Projects Administration, immediately adjacent to the main office building. This vault is of sufficient capacity to house all of the Department's records from the beginning to date, and in addition its anticipated needs for long time in the future.

The grounds adjacent to these buildings are being landscaped and planted with shruberry so as to conform to the beautification program of the Capitol Grounds Commission.

In-Service Training Program—Recognizing the fact that a trained employee contributes more efficient service, the Department, during the Biennium, has taken advantage of funds made available by the Federal Government and the State through the George Deen Act, and in cooperation with the Trades and Industrial Division of the State Department of Education and the Little Rock Public Schools has inaugurated an extensive program of in-service training for its employees.

More than twenty separate courses have been offered, all of which were selected with the purpose of increasing manipulative skills and augmenting the related knowledge of the worker toward the job. The voluntary response of the employees to these training courses has been quite gratifying to those in charge of this work. More than four hundred employees have availed themselves of this opportunity of "better-fitting the

man to the job."

The following courses are representative of those offered:

Engineering English Highway Accounting and Budget Control

Practical Office Procedures
Public Relations

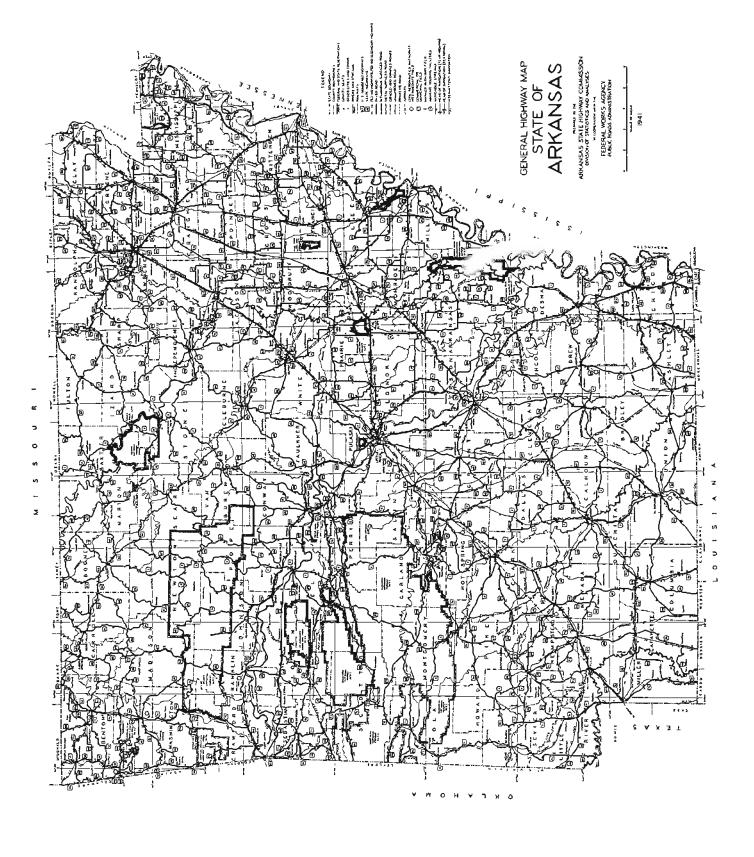

Highway Surveying Problems
Traffic Engineering Problems

Practical Mathematics
Free-hand Drawing
Highway Law
Driver Training

Accounting and Budget Control—One of the foremost steps taken by the Department was the adoption of a modernized accounting system whereby detailed, positive control of its fiscal affairs has been established. Under this system, which is explained in Section I, the current operating expenses of the Department are kept in constant comparison with the budget and in turn the budget with the appropriation.

Speed Zoning—In accordance with the authority given by Act 179 of 1939, which states that speed shall be determined by the State Highway Commission upon the basis of engineering and traffic investigations, speed zoning surveys have been made on 2290 miles of main highways. The safe speed of curves and turns was determined by the Traffic and Safety Division and appropriate signs erected indicating the safe speed.

Traffic and Wheel Load Survey—During 1939-40 the Department in cooperation with the Public Roads Administration completed the twelve months field work of a comprehensive traffic density and truck and bus loading study. These data when analyzed and assembled will indicate the extent and type of vehicles using our highways.

SECTION I

HIGHWAY FINANCE

FINANCIAL OUTLOOK

It is an indisputable fact that the service provided by the State Highway System can never be more adequate than the financial structure established by the State for its support. In order to provide satisfactory highway service, any plan of highway finance developed involves two equally important considerations, first, the source and amount of income produced, and second, the disposition or application of the income. As pointed out in the Introduction, the conditions under which the Department now operates are such that highway needs are not being adequately met. Therefore, it would seem that the existing financial plan deserves careful study in order that its defects, if any, may be remedied.

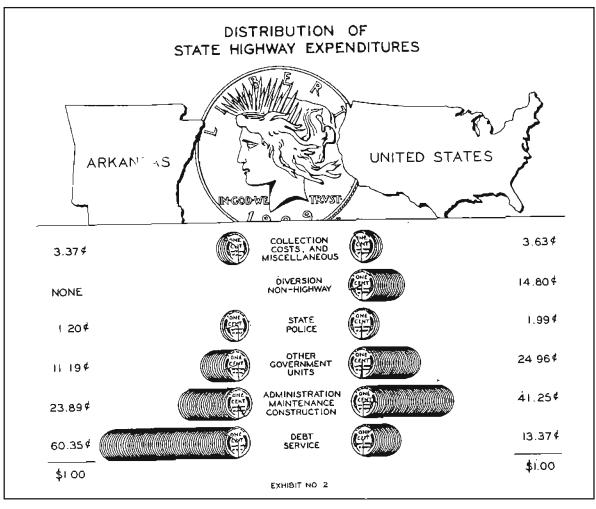

While the 1934 Refunding Law, under which highway finances in Arkansas are now controlled, was perhaps the best agreement that could be reached in the light of previous difficulties in servicing the highway debt, nevertheless, it is highly restrictive. The disparity in the distribution of highway income allowed by this law is shown by the following tabulation and Exhibit 2.

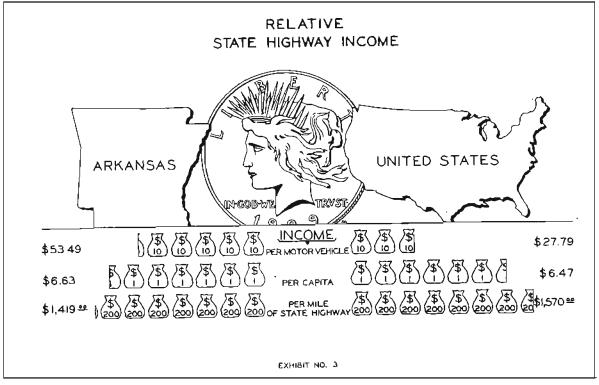

Disposition of State Highway Income

	Percent of Receipts	
	Arkansas	United States.
Item	(Cale	ndar Year)
Collection Costs and Miscellaneous		3.63
Diversion—Non-highway		14.80
State Police	1.20	1.99°
Other Governmental Units	11.19	24.96
Sub-total	15.76	45.38
Administration Maintenance and Construction	02.00	41.05
Administration, Maintenance and Construction		41.25
Debt Service	60.35	13.37
Total	100.00	100.00
Total	100'00	100.00

The most significant fact from the foregoing tabulation is that, while Arkansas is required to allot for debt service operation four and one-half times the national average allotment, our expenditure from state funds for administration, maintenance and construction is only slightly more than one-half the average expenditure of all the states. Further information in Table 18, "Analysis of State Highway Expenditures," included in the Appendix, indicates that Arkansas ranks last among the States in expenditure per mile for highway construction and seventh in debt service expenditure per mile. By reference to Exhibit 3 it can be seen that State highway income for Arkansas per motor vehicle, per capita and per mile of State highway compares favorably with the national average. That is, from the standpoint of highway revenues raised, the State is meeting its responsibility, but from the standpoint of highway expenditures for capital outlay and maintenance the State is failing to meet requirements for highway service. Sound business principles require that a balance be maintained between the demand for highway service and the financial outlay necessary to provide such service. For, after all, improved highways offer a commodity in economical, safe and comfortable travel for which the motorist is willing to pay in the form of motor user taxes.

Although by the careful use of Federal Aid allotments the Department has been able to continue its highway development, particularly the Federal Aid System, during the past seven years, yet the fact remains that the State highway financial structure is unstable and future progress is uncertain until remedial measures are taken.

FISCAL OPERATIONS

Accounting Methods—During the biennium exhaustive studies of the accounting practices of a number of the other State Highway Departments together with the recommendations of the Uniform Accounting Committee of the American Association of State Highway Officials have been made, following which a modernized accounting system was installed whereby detailed, positive control of its fiscal affairs has been established. International Business Machines, or the punch-card method of accounting was adopted and the machines installed April 1, 1939. The months of April, May and June were devoted to experimental work in preparing for actual operation, beginning July 1, 1939. By inaugurating an encumbrance system whereby all authorizations for expenditure, such as purchase orders and payrolls, are set up as bills payable against their respective District or Division Allotment, until such time as actual payments are made, it is possible to determine the true financial status by District or Division Allotment at any given period. In an organization of this size, the outstanding bills represent an unusually large figure—usually ranging from \$100,000.00 to \$175,000.00 In order to maintain a sound fiscal control, it is very necessary that an accurate total of outstanding bills be known at all imes

Budget Control—Since this system has been inaugurated, the Accounting Division has furnished semi-monthly detailed reports to each District or Division and a summary report is also furnished the executive offices semi-monthly showing accumulative budget allotments, encumbrances, expenditures, unencumbered balances and unexpended budget balances. Thus the current operating expenses of the Department are kept in constant comparison with the budget, and in turn the budget with the appropriation. Furthermore, the net balances in the budget are constantly available when additional authorizations are being considered. This has permitted the planned, orderly control of all of the Department's operations.

Expenditure Classification—The statistical data which are now available under this new system of accounting are varied and numerous and there are unlimited possibilities as the system progresses. Such information is of very material value not only in determining the various operating costs, but in allocating funds for each class of service in the future.

All expenditures are classified by an expenditure classification code system which enables statistical information to be furnished by route and section, county, district, or combinations of either. Route and section cost figures for the 1940 fiscal year, which are used in this biennial report, were compiled by the punched-card method as were the various statistical tables.

Equipment Rental—Another important feature that has never before been regarded in the Department's operations is that of equipment rental charges. Studies have been made whereby predetermined charges for the use of all equipment can be made so as to provide a reserve, or sinking fund, for the purchase of new equipment when the old becomes obsolete or worn out. There is an imperative need for the adequate capitalization of this account so that many pieces of equipment now in use that have exceeded their economic life can be replaced. Careful studies indicate that \$1,000,000 will be required for the proper capitalization of the equipment account, and while it is impossible to achieve this result at one time due to the volume and variety of other demands that are made on the maintenance account, an effort should be made to set up this amount over an extended period of time. Here again the plan contemplated is one that has long been used by private business, and it is hoped that the next biennial appropriation will be such as to permit its establishment.

Purchasing—One of the most important features of this system is that of centralized purchasing through the Little Rock office in lieu of the past practice of permitting the various departmental heads and district engineers to purchase independently. The value of this system has long been recognized by large business concerns and it has paid handsome dividends in the way of savings and economy to the Highway Department. By these means competitive prices have been obtained, business has been distributed throughout the State on an equitable basis, and savings realized on both discounts and current prices in the approximate amount of \$150,000 annually.

Financial Statement—The following condensed Financial Statement, Table I, reflects the fiscal operations of the State Highway Department and affiliated agencies during the past biennium. Following the summary statement are detailed schedules of receipts and disbursements for each fiscal period, together with an analysis of all items.

TABLE 1

		\$39,081,938.45

HIGHWAY INCOME

Income for State highway purposes includes the revenue derived from State imposed taxes, which consist principally of motor vehicle imposts, and Federal Aid of various types and classes.

State Imposed Taxes

Revenues derived from State sources for highway purposes include:

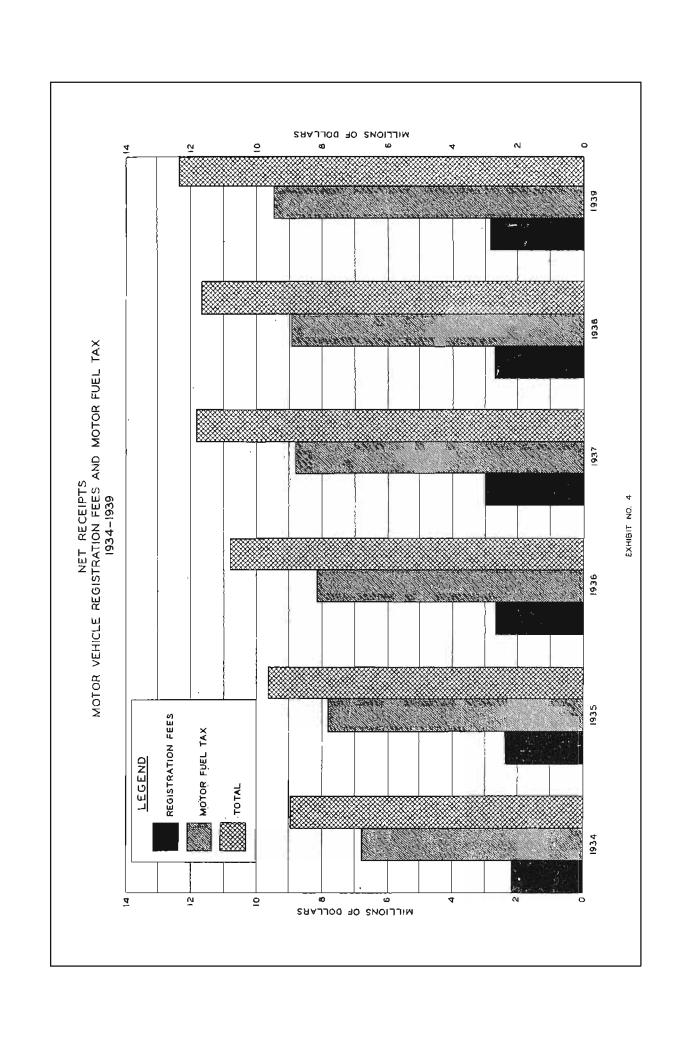

1. Motor fuel taxes

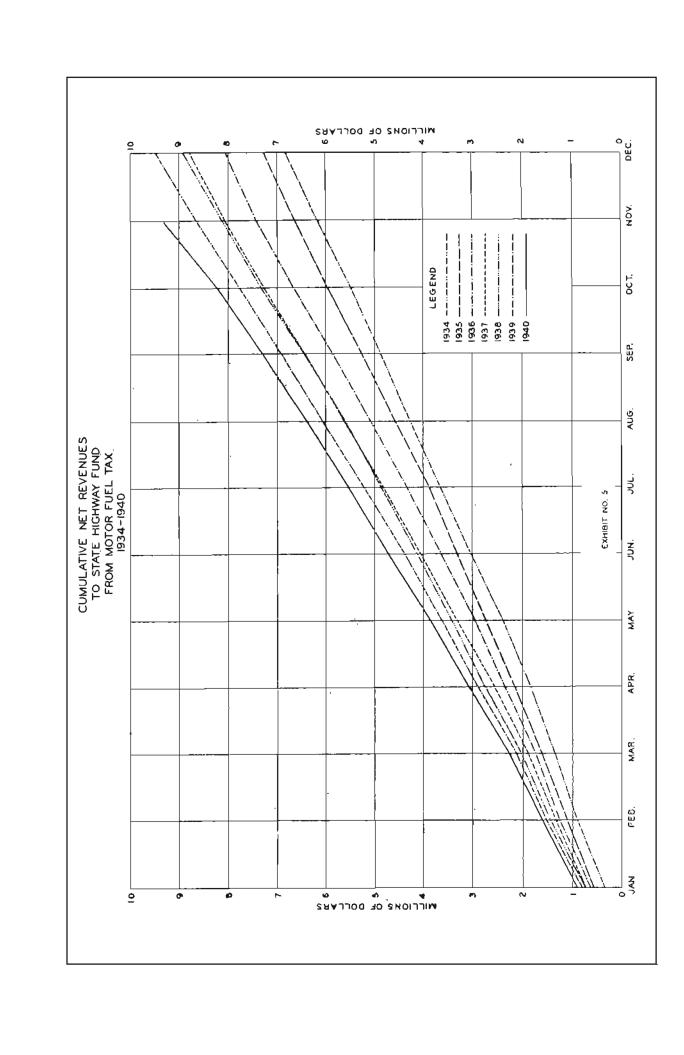

- 4. Drivers license fees
- 2. Motor vehicle registration fees
- 5. Oil inspection fees

3. Auto division fees

6. Auto in-transit fees

There are various other miscellaneous receipts from sales, interest and testing charges, plus an apportionment for the State Police Fund from all imposts collected by the State Revenue Department. For the purpose of this discussion, the total income from the foregoing items will be shown regardless of how the funds are finally distributed to other units of government.

Since 1933 the State highway income derived from the principal motor user imposts has shown a substantial increase for each succeeding fiscal year. The following tabulation of the gross receipts indicates the increase since 1934-35:

Item Motor fuel tax Motor vehicle registration Auto division fees	1934-35 \$ 7,960,531.43 2,309,941.58 37,114.13	1935-36 \$ 8.573,460.88 2,681,543.31 56,012.15	1936-37 \$ 9,607.697.14 2.990,468.14 56,306.00	1937-38 \$ 9,936,849.90 2,880,269.67 50,000.40	1938-39 \$10,316,760.00 2,860,267.01 54,799.33	1939-40 \$10,996,165.80 3,149,923.81 65,447.50
Gross totals	\$10,807,587.14	\$11,811,016.29			\$13,231,826.34 128.4	\$14,211,536.61 137.9

The only legislation affecting the foregoing receipts since July 1, 1934 was the provision of Act 13 of the special session of 1938 which provided that truck and trailer fees should be computed on the manufacturer's rated capacity rather than as heretofore upon carrying capacity. This action reduced to some extent the amount of registration fees received from these types of vehicles. The comparatively small increase for the two fiscal periods from 1937 to 1939 was due to the economic recession during the calendar year 1938. Exhibits 4 and 5 show graphically additional information regarding motor vehicle income.

Federal Aids and Grants

Resume—The State has been without funds for construction purposes since 1932, and since the operative date of Act No. 11 of the special session of 1934, it has been under a statutory prohibition as regards construction involving funds other than Federal allotments. All construction work accomplished during this eight-year period has been financed from Federal aids and grants.

Regular Federal Aid appropriations must be matched with State funds unless otherwise provided by law. Since other states also were laboring under financial difficulties similar to those of Arkansas, Congress in 1932 made an emergency appropriation of \$120,000,000 to be used by the several states in lieu of an equal amount of state funds to match regular Federal Aid funds. In this manner the State was enabled to take advantage of the 1933 Federal Aid allotment. No appropriations of regular Federal Aid were made for the fiscal year 1934-35.

Appropriations for the fiscal years 1936 to 1939 inclusive, were made available without the requirement of matching with State funds provided that the proceeds of all special taxes on motor vehicle transportation collected by a State were applied to highway purposes for which such proceeds were previously pledged. The Federal Toll Bridge Act, Public No. 286—75th Congress as amended, Public No. 195—76th Congress, also offered to aid the State under certain conditions. These conditions were met by the passage of Act 11 during the special legislative session of 1938 whereby all State-owned toll bridges were freed of tolls. This action established the State's eligibility to participate in the benefits of the Federal Act whereby credits representing fifty percent of the cost or value of these bridges, where located on the Federal Aid System, could be used for matching regular Federal Aid and Federal Aid Secondary funds up to one-half the allotment. Only under these conditions has the State been able to qualify for the Federal Aid allotments.

In addition to the regular Federal Aid appropriations Congress has also made appropriations in the form of grants for highway construction and for the elimination of hazards to life at railroad-highway grade crossings during the period from 1933 through 1941. For the fiscal years 1938 through 1941 Congress also authorized appropriations for the construction of secondary or feeder roads which are not on the Federal Aid System of roads nor potential additions thereto.

The State has also received each year an allotment of Federal funds for the construction of National Forest Highways located in the Ozark and Ouachita National Forest Reserves.

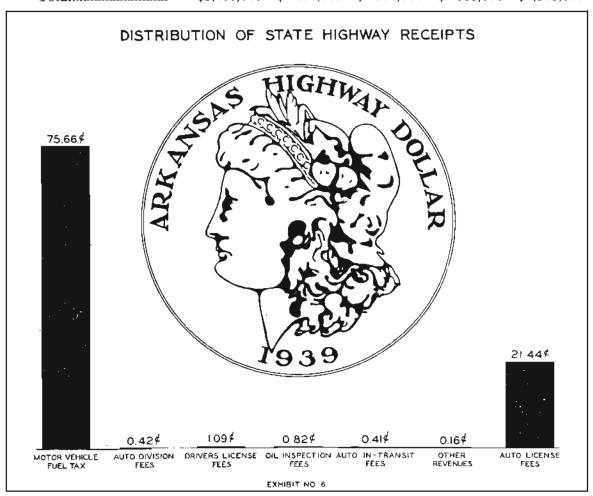

The tabulation on the following page indicates the total amount of funds available for the construction of State highways in Arkansas since 1932, except for a negligible amount of State funds expended for surveys, plans and miscellaneous items not eligible for payment from Federal funds.

	Grants						
	Regular Federal Aid	Secondary Federal Aid	Highways	Grade Crossings	National Forest	Total	
1934	\$ 1,846,477	\$	\$ 2,101,182 6,748,335	\$	\$ 153,712 192,527	\$ 4,101,371 6,940,862	
1935 1936 1937	2,142,723 2,133,206		3,428,049 3,352,061	3,574,060	76,504 77,293 82,254	3,504,553 9,146,137 2,215,460	
1938 1939	2,187,752 2,132,790	437,550 426,558		893,403 865,366	111,905 113,761	3,630,610 3,538,475	
1940 1941	1,702,583 1,955,081	255,387 $255,011$		343,731 510,125	81,752 110,023	2,383,453 2,830,240	
Totals	\$14,100,612	\$ 1,374,506	\$15,629,627	\$ 6,186,685	\$ 999,731	\$38,291,161	

Attention is called to the fact that the allotment of Federal funds for a particular fiscal year bears no relation to the amount of such funds received or disbursed during the corresponding fiscal period as shown in the table of receipts and disbursements.

Current Funds—Public No. 780—76th Congress, approved September 5, 1940, authorizes appropriations of regular Federal Aid, secondary or feeder road funds, forest highway funds and grade crossing funds for the fiscal years 1942 and 1943. Arkansas' apportionments of these appropriations will be in the following approximate amounts:

Fiscal	Regular	Secondary	Forest	Grade	
Year	Federal Aid	or Feeder	Highways	Crossing	Total
1942	\$1,700,000	\$ 300,000	\$ 80,000	\$ 344,000	\$2,424,000
1943	1,700,000	300,000	80,000	344,000	2,424,000
Total	\$3,400,000	\$ 600,000	\$ 160,000	\$ 688,000	\$4,848,000

The Act provides for use of the 1942 and 1943 fiscal year apportionments of regular Federal Aid and Federal Aid secondary funds without being matched with State funds under the same requirements applicable to previous apportionments with the added proviso, however, that any such funds made available to any State without being matched by the State shall be expended on the system of Federal Aid highways and on secondary roads in the construction of projects desirable from the standpoint of national defense. This provision will operate through the fiscal year 1943, after which date no funds other than the balance in the toll bridge account will be available, and the State will again be without the means of financing a construction program unless, in the interim, refunding is accomplished and the State again has the authority to use its own funds as and where it sees fit.

Resume of Highway Income

A consolidated statement of all highway income received during the biennium is shown in Table 2 while more detailed statements are included in the appendix, Section VI. Exhibit 6 indicates the source of each State Highway dollar.

TABLE 2

Receipts for Highway Purposes from July 1, 1938 to June 30, 1940

7.	Miscellaneous receipts		2,025.21	7,802.38	9,827.59	
8.	Other revenues—State Police		12,761.91	18,640.64	31,402.55	
	Total State funds	\$	13,124,019.09	\$14,144,058.46	\$27,268,077.55	
	FEDERAL	F	UNDS			
9.	Regular Federal Aid	\$	4,162,600.39	\$ 2,713,695.90	\$ 6,876,296.29	
10.	National Industrial Recovery Fund		7,064.34		7,064.34	
11.	Works Program Fund		497,969.85	152,253.09	650,222.94	
12.	Toll Bridge Reimbursement Fund			1,366,085.97	1,366,085.97	
	Total Federal Fund	\$	4,667,634.58	\$ 4,232,034.96	\$ 8,899,669.54	
	Total Receipts all Funds	\$	17,791,653.67	\$18,376,093.42	\$36,167,747.09	

Item 1 indicates the net amount of income received each fiscal year from the 6½ cent motor vehicle fuel tax. The amounts shown include the 7.7 per cent and the ¼ cent per gallon specifically committed by law as the counties' share of this impost. The pro rata share allocated to the State Police Fund is also included in the amounts shown.

Item 2, Auto License fees, shows the net amount received by the State Treasurer during each fiscal year for the registration of motor vehicles and trailers.

Item 3, Auto Division fees, represents the income derived from chauffeurs and extra dealers licenses, transfers of title, duplication of lost licenses, duplicate registration cards and penalties.

Item 4, Drivers License fees, indicates the receipts from the sale of operators' or drivers' licenses. Although the income is allotted to the State Police fund it is considered a source of highway revenue.

Item 5, Oil Inspection fees. All receipts derived from the fees charged for the inspection of petroleum products are committed for highway purposes and credited to the Special Highway Improvement Fund.

Item 6, Auto In-Transit fees, represents revenue received from licenses issued for motor vehicles passing over State highways in course of delivery from manufacturer to dealer. This income is considered a source of highway revenue, although credited directly to the Bridge Bond Retirement Fund.

Item 7, Miscellaneous receipts, includes such items as bond forfeitures, motor carrier

permits, and delinquent taxes from road improvement districts.

Item 8, Other Revenues, State Police. In the event the income derived from drivers license fees is insufficient for the operation of the State Police, all revenues credited to the Unapportioned Fund may be charged with a pro rata share of the amount needed for the operation of this agency. The amounts shown are the transfers made to the State Police fund during the biennium from taxes other than motor vehicle imposts.

Items 9 through 12 represent the cash receipts of the State Treasurer collected on reimbursement vouchers submitted for payment by the Department on the various types of Federal funds under committment, together with any funds received as revolving or trust funds. Each receipt is credited to the proper paying account for disbursement by the Highway Department.

HIGHWAY EXPENDITURES

During the biennium under review, the total expenditures for highway purposes from State funds and Federal aids and grants was \$35,527,404.40. This amount includes that portion of the highway income shared with local units of government, such as the county turnback, and expenditures for debt service, aids to improvement districts, and expenditures of the State Police. These expenditures were divided: \$8,552,850.74, or 24.1 per cent, from Federal sources, and \$26,974,553.66, or 75.9 per cent, from State sources. Table 3 shows the disposition of highway income for each fiscal year of the biennium, while further detailed tabulations of the disbursements are included in the Appendix.

TABLE 3 Disposition of Highway Income for the Biennial Period Ending June 30, 1940

Analysis of Expenditures

Item 1, Special Highway Improvement, represents the amount expended for maintenance and betterment from a special fund created by Act 12 of the special legislative session of 1938. The revenue for this fund is derived from oil inspection fees, table 2, item 5, from the unsued portion of a \$100,000.00 fund for toll bridge maintenance established by Act 11 of 1934, and \$16,300 previously allotted from the Highway Fund to the General Revenue and Auditorial Funds. In order to check the disbursement of \$723,843.55 shown in Table 8, \$25,000.00 advanced to Engineers Revolving Fund, Item 5, must be added.

Item 2, Maintenance of Highways, shows the disbursements made for road maintenance from the Highway Maintenance fund. A further detail of maintenance disburse-

ments is shown by items 3, 5 and 6 of Table 13.

Item 3, Administrative, also expended from the Highway Maintenance Fund, items 1 and 2, Table 13, represents the cost incident to the operation of the State Highway Department, including salaries of administrative officials, engineers, and clerical workers, supplies, insurance and travel expense. There is included in the cost of administration for the biennium the sum of \$73,197.15 representing the cost of the new Highway Administration building. The following analysis indicates the relative cost of administration during each fiscal year of the biennium.

Highway Operations, State Funds Construction, Federal Aid	1938-1939 3,521,629.03 4,474,369.50	\$ 1939-1940 3,416,664.42 4,078,481.24	\$ Biennium 6,938,293.45 8,552,850.74
Total	\$ 7,995,998.53	\$ 7,495,145.66	\$ 15,491,144.19
AdministrativePercent	\$ 554,093.51 6.93	\$ 566,652.19 7.56	\$ 1,120,745.70 7.23

Item 4, represents salaries and expense for surveys, plans and other items ineligible

to Federal Aid participation which were paid from the Maintenance Fund.

Item 5, represents advances made during the biennium to the Engineers Expense Revolving Fund, a reserve operating account established in order to expedite the payment of salaries and expenses to the men employed on Federal Aid Projects. Of the \$110,000.00 advanced to this fund, \$25,000.00 was transferred from the Special Highway Improvement Fund and the balance from the Highway Maintenance Account. Disbursements made from this fund are reimbursed from Federal Aid payments.

Item 6, Geological Survey Cooperative, represents contributions toward the expense of special surveys made by the U.S. Geological Survey, which provide information for the benefit of highway construction and maintenance. This is appropriated out of the

Highway Maintenance Fund.

Item 7, Bond Refunding Expense, represents administrative and maintenance expense of the Bond Refunding Board and legally established claims in connection with debt service.

Item 8, Fiscal Agents fees, represents fees and commission in connection with prin-

cipal and interest payments on State Highway Bonds.

Item 9, State Police, shows the amount expended for the operation of this agency for each fiscal period. The necessary funds are derived from drivers license fees, Item 8, and other revenues, Item 12 of Table 2.

Item 10, Interest on State Highway Obligations, indicates the amount expended for interest during the biennium on the six classes of State Highway obligations. This amounted to slightly more than 40 percent of the total amount spent for highway pur-

poses from State income.

Item 11, Retirement of Obligations, shows the amount expended for the purchase of Highway Obligations tendered by the holders of the various classes of bonds, under the provisions of Act 11 of 1934. Considering only State funds, 22.5 cents of each dollar expended for highway purposes was for retirement of the bonded debt.

Item 12, A, B and C, represent aids, grants and shared taxes to local units of gov-

ernment which were distributed as follows:

Road Improvement Districts Bridge Improvement Districts County Road Funds	334,825.38
Total	
Revenues for these aids and grants originated from the	following sources:
Motor Fuel Tax 7.7% County Turnback Motor Fuel Tax 1/4c per gallon	
Total from motor fuel taxAuto In-transit feesBridge District collectionsAppropriations from bond redemption accounts:	103,378.77
Act 10, 1938—balance of appropriationAct 325, 1939Act 330, 1939	140,000.00
Total	\$2.867.084.86

Items 13 to 18, inclusive, represent actual disbursements of the various classes of Federal funds received by the State.

The following summary statement prepared from table 3, shows an analysis of the funds expended from State revenue according to purpose of expenditure.

-	1938-1939		1939-1940		Total	
	Amount	Per Cent	Amount	Per Cent	Amount	Per Cent
Debt service and expense	\$ 7,566,041.30	60.38	\$ 9,242,375.43	63.99	\$16,808,416.73	62.31
Miscellaneous items ineligible for Federal Aid	119,911.91	0.96	103,289.24	0.72	223,201.15	0.83
Maintenance and betterment	2,802,623.61	22.36	2,669,222.99	18.48	5,471,846.60	20.29
Administration-State Highway Commission	554,093.51	4.42	566,652.19	3.92	1,120,745.70	4.15
Other Highway Expenditures	45,000.00	0.36	77,500.00	0.54	122,500.00	0.45
State Police	151,233.08	1.21	209,525.54	1.45	360.758.62	1.34
Aids and shared taxes to other units of government.	1,292,271.40	10.31	1,574,813.46	10.90	2,867,084,86	10.63
Total	\$12,531,174.81	100.00	\$14,443,878.85	100.00	\$26,974,553.66	100.00

From the above figures it appears that for the biennium an average of approximately 62.31 per cent of the total highway expenditures was for bond interest and retirement, leaving only 37.69 per cent for all other highway functions, exclusive of construction work which cannot be accomplished from the State revenues under existing statutes.

HIGHWAY DEBT STRUCTURE

Although debt servicing operations are not administered by the State Highway Commission, activities of this department are dependent to a considerable extent upon the amount of highway revenues necessary for debt service requirements which would otherwise accrue to the department for the purpose of construction and maintenance of additional highway facilities. Therefore, the important relation between the highway program and debt status requires a resume of the latter to anticipate the extent of operations for the former.

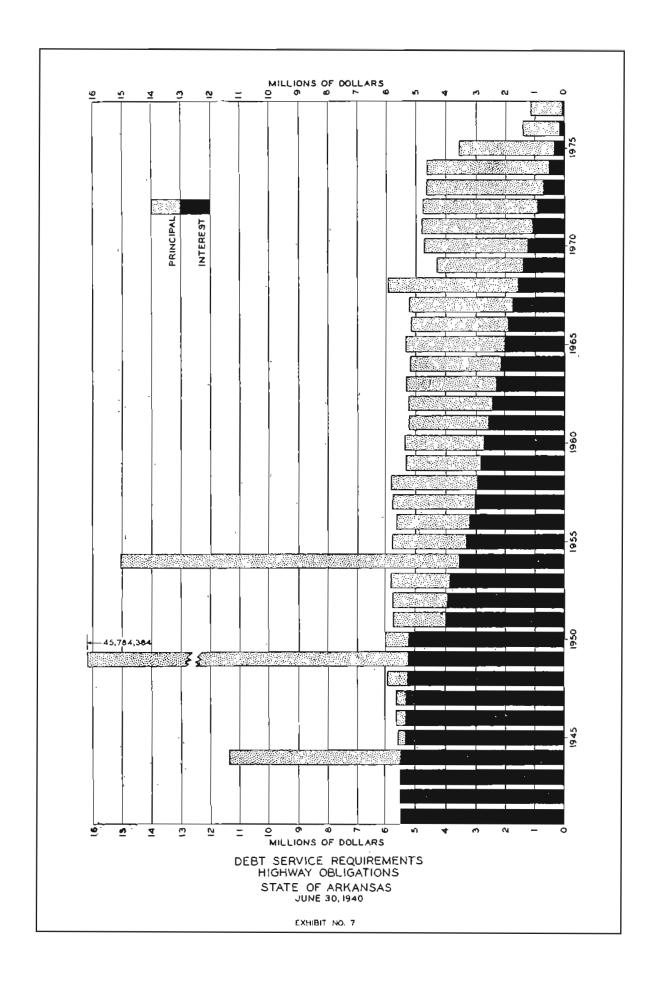

Act No. 11 of the Special Session of 1934, which authorized the refunding issues of highway obligations incorporated a binding covenant between the State and its bond holders whereby 25% of the net revenues to the State Highway Fund is reserved for maintenance and administration and the balance, except for some nominal amounts, is pledged exclusively to debt service.

Retirements and Status—During the biennium ending June 30, 1940, a par value amount of \$6,507,912.57 of these obligations were retired by purchase under provisions of tender as follows:

	Fiscal Year					
	1938-1939	1939-1940	Total			
Par Value	\$2,807,850.14*	\$3,700,062,43	\$6,507,912.57			
Cash Value	2,456,805.82	3,608,743.87	6,065,549.69			
Savings	\$ 351,044,32	\$ 91.318.56	\$ 442,362.88			
Savings \$\\$ \\$51,044.32 \\$ 91,318.56 \\$ 442,362.88 * Includes \\$74,228.72 \\$ tate-owned bonds cancelled June 30, 1938.						

The following information presented in "Financial Analysis State Bonded Indebtedness" published by the office of State Comptroller dated June 30, 1940, reveals the status of State Highway Obligations as of that date as follows:

Highway, Series "A" Highway, Series "B" Toll Bridge, Series "A" Toll Bridge, Series "B" DeValls Bluff Bridge Road District, Series "A" Road District, Series "B" Certificates of Indebtedness (Streets)	8,267,576.26 5,651,000.00 777,925.24 231,140.80 37,474,225.00 2,207,326.81 5,707,321.27

Certificates of Indebtedness (Streets)	467,901.03	404,340.11	63,560.92	13.58
Funding Notes (Contractors)	333,311.79	308,717.92	24,593.87	7.38
Totals	\$23,063,313.07	\$19,396,211.05	\$ 3,667,102.02	15.90

Debt Service Requirements—Total debt service requirements from State Highway Fund rvenues as of June 30, 1940 were: principal, \$136,837,190.77; interest, \$109,575,858.07, or a total of \$246,413,048.84. The annual requirements are shown graphically in Exhibit 7 and in Table 20 in the Appendix. It will be noted that the present outstanding indebtedness amounts to \$136,837,190.77 with an annual interest requirement of \$5,515,603.42 or an average interest rate of 4.03% per annum.

While present revenues will substantially satisfy normal maintenance requirements and provide funds for the liquidation of interest maturities, the fact remains that some form of re-financing will become necessary in advance of the principal and interest maturities of \$11,367,274.69 during the fiscal year 1943-1944.

It is hoped that the problem of refunding will receive considerable study by the current session of the General Assembly and that definite action will be taken to arrange a satisfactory schedule of retirements which will remove the present restrictions on highway development in Arkansas.

SECTION II

CONSTRUCTION OF HIGHWAY FACILITIES

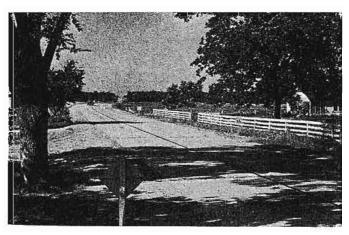

Measured by modern demands, the condition of the State highway system of Arkansas is far from adequate and while it is being rebuilt as rapidly as finances will permit, yet as in the past, the constant demand upon the Department is for additional paved roads. When it is remembered that our system of State highways has been developed by the process of incorporating former local roads and adapting these to the requirements of modern traffic, it is easily understood why more and better construction is still the paramount need.

The highway construction program of the Department is executed through the cooperation of four divisions, Plans and Surveys, Road Construction, Bridge Construction and Materials and Tests.

REQUIREMENTS OF MODERN TRAFFIC

The purpose of the State highway system is to provide means for the safe and economical passage of the various classes of travel and commercial haulage from one community to another, either local, state, or national. The record made in this country during the past twenty-five years in the development of highway transportation is without parallel in the history of commerce. This development has been made possible by the resourcefulness and ability of the manufacturers in the improvement of the motor vehicle and the cooperation of public officials in providing funds for the construction of roads.

At the inception of general highway construction in Arkansas the location and plans for all roads were more or less influenced by local considerations, that is, each road was laid out so as to serve as many farms and local communities as possible. Practically the only design consideration was that some type of all-weather road be built which was adequate for the slow traffic and light tonnage.

Meeting Modern Traffic Demands

Former Adequate Construction Now Hazardous-The mechanical development of the automobile and the truck with regard to speed and load capacity during the past twenty years has had a revolutionary effect on highway design and construction methods. Highways once local in character have become arteries of commerce between large cities. Modern requirements to accommodate the increased traffic volume, higher speed, and heavier tonnage have rendered many of our former highways which were once adequate for the safe operation of vehicles in use, obsolete and dangerous in numerous sections. It would not be economically feasible for the State to

contstruct highways which would be safe for the highest speeds that cars are capable of making, but the trend toward higher speeds cannot be reversed by constructing or retaining highways that are unsafe for ordinary speeds. The work required on the highway system today includes not only the construction of additional highways but the modernization of existing roads. Meeting the present traffic demand for improved highway facilities in Arkansas has become a problem of major proportions.

Modernization and Replacement Needs - Obviously, in order to keep apace with modern traffic requirements, many improvements should be made on all the State roads. Such improvements involve revising the alignment even to the complete relocation of some sections, modifying gradients to allow sustained speeds and adequate sight distances, widening of roadbeds and surfaces, reduction of horizontal and vertical curvature, widening of narrow bridges, replacement of structures that are not safe for loads of present day traffic, elimination of hazardous railroad crossings, and a careful selection of the wearing surface. Highways are now designed for an assumed average speed, which on the more important routes is 60 miles per hour. In order to maintain such a standard practically all roads built during the road improvement district era have become obsolete and the roads built approximately ten years ago have lengths of inadequate sight distance and excessive curvature that should be reconstructed for short distances in order to maintain the desired design speed over the entire section of highway.

Gravel roads that were satisfactory a few years ago have now become inadequate. The increased volume and speed of traffic have made the dust nuisance a manifest hazard so that dust palliatives have become a practical necessity on all roads of this type.

Once Adequate

A considerable portion of our more important highways are constructed with an 18-foot width of pavement. The increase in volume of traffic including an ever-increasing amount of large trucks makes a greater width than 18 feet desirable, however, reconstruction of such sections where otherwise satisfactory is not justified at present. As an added protection, however, wider shoulders and flatter slopes are being constructed as rapidly as possible. This work will not only make the highways safer, more comfortable to travel and more economical to maintain, but will also permit a definite increase in the speed of traffic. Such improvements, however, have to be made consistent with funds available, and allocation of funds can be made only after careful consideration of the importance of the route from the standpoint of the traffic using the road.

Immediate Construction Needs—The major problem of those charged with highway administration in Arkansas is the correlation of the immediate highway construction needs with the funds available. Even though it is common knowledge that under existing conditions the State has no means of financing a highway construction program, nevertheless, our immediate and imperative highway needs should be squarely faced at this time in order that drastic or emergency measures will not be necessary in the near future. So with an effort to be conservative the following items appear to be of primary importance of the aim of improving the highway facility commensurate with the increasing volume and character of automotive traffic.

All State highways designated as U. S. highways have an inter-state as well as intra-state value and the completion of these routes to meet modern standards as to dustless surfacing and speed requirements is mperative. These routes have a total mileage of 2,738, approximately 30 percent of the entire system, of which 2,143 miles are paved with a dustless type of surfacing. The tabulation on the opposite page indicates the total mileage, and the mileage considered as having inadequate surface, alignment and grades for present traffic conditions and in need of immediate improvement.

It is estimated that reconstruction and improvement of this 597 miles of inadequate highway to meet present day standards and traffic requirements would cost more than fifteen million dollars—this with no thought of future demands.

Replacements	Must	Provide	for	Increased	Loading

U. S. Highway	Total	Mileage Needing
Number	Miles	Replacement
61	71	O
62	259	1(1
63	133	60
64	253	32
65	322	56
67	308	8
70	296	51
71	310	1 L
79	271	156
82	190	21
165	42	36
167	135	U
270	148	5 5
	~ ~	
Totals	2,738	597

In addition to the U. S. numbered Highways many State highways are of equal importance to our transportation system. A conservative estimate of the mileage in need of immediate improvement on these routes is 525.

The magnitude of the immediate highway construction needs serves to emphasize the necessity for studying carefully all data before projects are programmed in order that the priority finally established may be on the basis of highway needs and funds available.

CONSTRUCTION POLICIES AND TRENDS

Although the State Highway Department is essentially a production organization whose major function is the construction and maintenance of highways, yet, in many instances, there are numerous problems incident to these operations which must be solved before actual work can be begun. Continued study and research is necessary in order to insure that any highway service for which public funds are expended shall be adequate, economical, and safe. Also the rapidity with which construction, design and maintenance practices in highway engineering are changing to meet traffic needs soon renders present methods obsolcte unless some effort is made to keep abreast of the times.

Due to the fact that under existing statutes, funds cannot be specifically committed for work of this nature, the only progress possible has been that in the field of design and testing incidental to the prosecution of regular construction projects, plus certain experimental work in connection with routine maintenance.

Design Criteria—Within the past two years the American Association of State Highway Officials has developed a number of "policies" with the objective of standardizing, within practical limitations, the geometric design of highways throughout the United States, and Arkansas is endeavoring to cooperate fully in the attainment of this objective.

The principal factors affecting the design of highways are the speed, density and character of traffic and the size and weight of the vehicles that compose the traffic. Other essential factors that must be considered are the safety, comfort and pleasure of travel. The design speed of a highway is the speed for which all component parts of the highway are designed. It is determined by consideration of the topography of the area traversed and economic justification based on traffic density and other pertinent factors.

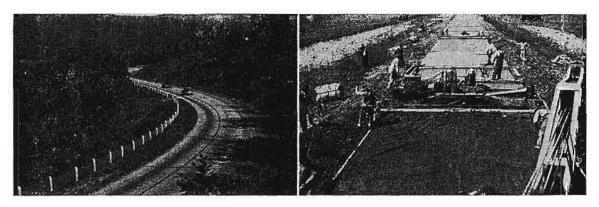

In general the aims as being developed by this department are as follows:

Highway design and construction should be based on a classification set up from factors of (a) traffic density. (b) character of traffic, (c) assumed design speed and (d) weight of traffic. Existing traffic density is usually expressed as the average 24-hour traffic volume and this information is obtained from records of the Division of Statistics and Analyses; by character of traffic is meant the proportion of passenger vehicles and trucks; the assumed design speed is the maximum uniform speed adopted by the group of faster drivers; weight of traffic is the load limit which is regulated by

statutory rules and regulations with respect to the load capacity of given sizes and numbers of tires on the vehicle.

As traffic density is more or less constant for a given location, and the character of the traffic is fairly uniform on all the highways, and the weight of traffic is regulated by legislation, the geometric design of the highway is dependent to a greater degree on the assumed design speed. Since speed is a function of curvature and grade, the problem of design becomes a matter of selection in design speed. In general we have adopted 60 miles per hour for primary roads and 50 miles per hour for secondary roads. These values in turn regulate the width of traffic lane, the minimum sight and stopping distances, maximum horizontal curvature, superelevation of curves and the location of signs and markers.

In Arkansas roughly two-thirds of the surface area of the State consists of terrain falling within the classifications of "rolling" to "rugged mountainous." The economics of high speed design for highways in this area creates a difficult problem for the Division of Plans and Surveys. A normal \$10,000.00 per mile road design for the gulf coastal plain area increases to \$50,000.00 per mile on the rough sections of the Ozark Region when plans for both are based on the same design criteria.

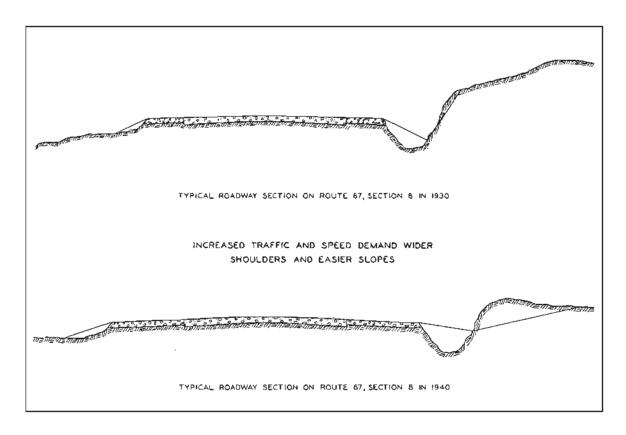

Ozark Mountain Region Gulf Coastal Plain

Design cost varies with location of highway

Change in Typical Sections—Speed enters the second phase of design by necessitating wider typical sections. As speed increases, width of driving space must increase. The effect on crown width, shoulder width and right-of-way width is very apparent when modern road designs are compared with those of ten years ago. The 60-mile an hour speed of today demands and obtains more effective width in all elements of the typical section. Twenty-two feet for two lane surfacing today replaces eighteen feet of 10 years ago, while eight feet of shoulders are constructed where four seemed sufficient 8 years ago. Cut sections are widened out with the accompanying appearance of flatness on modern designs by using 3 and 4 to 1 back slopes instead of 2 to 1. Embankments have undergone the same transition due to 3, 4, and 6 to 1 fill slopes instead of $1\frac{1}{2}$ and 2 to 1. This entire re-design of the typical section giving more width and the appearance of flatness, tends to tie the roadway itself closer to the surrounding terrain although the cuts and fills may be greater.

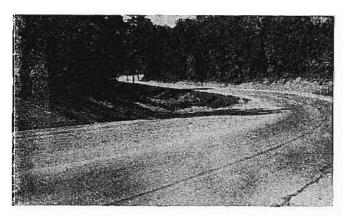

Safety Design—The complemental factor of speed as a basis of design must be safety. The high accident rate on the State highway system has focused the attention of highway officials and the general public on the problem of safety. In modern highway design it is inter-related with all other factors and no element of the roadway is designed without giving consideration to its effect on the safety of travel. The construction of a highway is an invitation to the public to use it and we are continuously inviting people from other states to use our roads; therefore, it is essential that every effort be made in the design and maintenance of the highway to provide for the safety, comfort and pleasure of travel.

Sight distances to conform to the limitations set up must be sufficient for one vehicle to pass another at given speeds without interfering with approaching traffic or must be sufficient to bring the vehicle from design speed to a complete stop before reach-

ing a stationary object in the same lane. In obtaining these distances perception time, brake reaction time and braking distances must be taken into account. For example, the minimum passing distance at 50 miles per hour is approximately 1,400 feet and at 60 miles per hour is 2,100 feet. Minimum non-passing distances at 50 miles per hour are considered as 350 feet and at 60 miles per hour 475 feet, using conservative values as a basis for the computations. Traffic lanes of 10 feet are considered minimum and 11 feet or even 12 feet desirable under certain traffic conditions.

Due to increased volume of traffic and the speed at which vehicles now travel wider shoulders have become imperative as a safety measure. If wide shoulders cannot be constructed throughout the length of the work, provision is made at frequent intervals for driving off the pavement. As a development of this need the typical section has become wider with as much as a 40-foot crown for two-lane traffic where possible and deep side ditches eliminated. typical section permits sodding to prevent erosion, has a more pleasing appearance and provides a much greater safety factor.

High Speed Requires Increased Sight Distance

Increased traffic has presented particular problems at intersections and in designs of these, recognition is made of the factors involved such as width of turning lanes, stopping distances, sight distances, congestion of traffic and channelization with an endeavor to maintain fluidity of traffic with maximum safety.

Whether the objective of building safety into our high speed highways is being reached can only be recognized later when accident statistics have recorded the results.

Utilization of Local Materials—Arkansas is continuing its established policy of endeavoring to design each construction project so that maximum value may be realized through local materials and existent conditions. This policy is economically sound particularly in view of the enormous mileage in our highway system and the urgent demands for more construction than is financially possible through our limited revenues. This has resulted in recent development of what is termed low-cost construction, enabling us to build four or five miles of highway for the cost of one mile of high-type construction. Naturally, we should expect the maintenance expense on these low-cost projects to be heavier than on the high-type pavements, but if only high-type pavements were constructed our small revenues would not permit many of us to see the completion of the highway program.

Research work with soils, asphalts, and cement have resulted in the adoption of soil stabilization specifications that are often found suitable for low-cost construction projects and while these projects have not been in use long enough for definite conclusions to be reached, we are greatly encouraged by results obtained at this time and confidently look for rapid and continuous advancement in this field of endeavor.

PLANS AND SURVEYS

The function of the Division of Plans and Surveys is, after allocation of funds has been made for any particular improvement on a highway or, in anticipation of such improvement, to make the required surveys to obtain the information necessary for preparing plans, securing the right-of-way, and editing the specifications up to the point of taking bids on the work. The refinements in modern highway construction have necessitated more details in the survey and design, which naturally requires more time and study to fully prepare a set of plans, but such details are fully justified since careful study reduces unit costs and saves money in the final cost of construction. The preparation of a complete set of road plans requires consideration of at least three distinct operations, namely, location, design, and specififications and standards.

Location—In making location surveys for highways, there are numerous phases of highway construction which must be considered, such as (1) the maximum amount of service which may be obtained with the minimum amount of construction and maintenance cost; (2) the general topography along the proposed routes; (3) present improvements along the route and how they will be affected by changes in location; (4) the type and kind of vehicles which will use the highway; (5) and finally, the service as to convenience and safety the road will provide. The location engineer must consider drainage conditions, right-of-way width, and secure all other pertinent information which will enable the designer to prepare a set of plans which will give the contractor definite information regarding what he is to bid on and construct, and which will enable the construction engineer to supervise intelligently the construction of the project. Efficient location survey involves the study of aerial photographs and topographical maps combined with careful reconnaissance work.

Location to Avoid Traffic Congestion—Junction of U. S. 64 and 65 at Conway

Design—Highway and bridge construction plans have become more detailed, more technical, and far more comprehensive than in the early days of highway building. Not only are grades, alignment and sight distances established, but practically every other construction feature is shown in detail on the plans. All units for the different items of construction are computed, and an estimate of quantities is prepared before the project is let for contract. The designer must constantly strive for a balance between three criteria, economy, safety and speed, in the preparation of all highway plans. Specifications and Standards—Specifications and construction standards form an integral part of all construction plans, governing construction methods, implements, machinery, equipment, tools, materials, supplies and labor necessary to the prosecution and completion of a project. During the biennium the Department issued and put into effect a revised set of standard specifications for the construction of highways and bridges, supplementing the issue of June 30, 1936. Each section was carefully revised and new sections added in order to keep current with the ever-changing methods and conditions required in highway construction. Standard drawings for various phases of highway work, such as typical roadway sections, require constant revision to meet increased traffic demands. The plans for each separate project also require the preparation of various "Special Provisions" which govern conditions or materials peculiar to that project.

Organizations and Methods—The organization fluctuates in personnel with the amount of work in progress, or contemplated, but in general consists of one titular head of the Division, two assistant engineers, one right-of-way engineer, two locating engineers, one chief draftsman and a varying number of detail draftsmen. One assistant engineer is in charge of plans, edits the specifications, coordinates all pertinent information originating in other Divisions and from outside. One assistant engineer makes preliminary reports on contemplated projects, has partial supervision of field parties, and attends to odd outside investigations. The right-of-way engineer makes up the court orders for right-of-way acquisition and is the contact man with all county judges and property owners involved. The locating engineers, with personnel consisting of one instrumentman, two or three rodmen and two or three axemen or helpers, make the surveys for improvement and obtain all information necessary for the design and preparation of the plans.

Organization of the drafting room personnel is built around four squads and a Chief Draftsman. Fluctuations in amount of plan work produced is met by the elasticity of the individual squad. The nucleus of each squad is maintained and it can be expanded to meet the demands. An effort is being made to use and encourage student engineers from the various State schools during summer vacations thereby building up a reserve supply of draftsmen and designers. Four squads of five men each are capable of producing road plans for four million dollars worth of road construction a year.

Each squad, functioning under a squad leader, is capable of producing a set of complete plans from field notes to final release of the tracings. They are advised as to design, speed, typical cross section and surfacing type. The field plans-in-hand inspection notes are made available to them for their guidance. Standard drawings, maps and other incidental work are handled under the direction of the squad leaders.

ROAD CONSTRUCTION

During the biennium of 1939-1940, as has been the case since 1933, highway construction has been administered by a central organization called the Construction Division. The primary functions of this Division are: lay out the proposed work for the guidance of the contractors in accordance with lines and grades established by the plans; supervise the manner of performance and rate of progress of the work to the end that projects will be completed in accordance with plans and specifications; anticipate any changes that may be necessary to secure the desired results; and, determine the amount and quantity of work performed and materials furnished which are to be paid for under the contract. Of equal importance is the function of studying and determining the practical workability of new methods and designs and devising better ones.

Personnel

The administrative personnel includes the Construction Engineer and three or four Assistant Construction Engineers, an Office Engineer, a Final Estimator, a fluctuating number of Assistant Estimators and one Stenographer.

The field forces of the Construction Division consist of a varying number of Resident Engineers, their instrument crews, office engineers, and inspectors. The number of residencies has varied, according to the weight of the program and the season of the year, from approximately ten to forty. When the construction program is light, the planning program is usually heavy, and during periods of inactivity in construction the

surplus of resident engineers is assigned to the Division of Plans and Surveys for location work or the preparation of plans.

Construction Activities

During the past two years from November 1, 1938 to November 1, 1940, contracts have been awarded covering the following highway improvements: Grading and minor drainage structures, 315.56 miles; Base course, 233.76; Gravel surfacing, 120.89 miles; Concrete pavement, 43.41 miles; and, Bituminous surfacing, 249.33 miles. These figures include the construction work performed on county roads from Secondary Federal Aid funds.

Certain of these projects deserve special mention because of the added highway facilities provided or the type and method of construction involved.

Inter-state Routes—In March, 1939, the paving of an important gap in one of our inter-state trunk lines was completed. The project consisted of 4.683 miles of concrete pavement on U. S. Highway 64 between Russellville and London, the completion of which enables inter-state traffic to travel on pavement throughout Arkansas from West Memphis to Fort Smith.

Another important trunk-line gap was paved in 1939 between Bradford and Newport, Highway 67. This job consisted of 15.685 miles of concrete, costing \$352,962.80. Inter-state traffic is now enabled to travel on pavement from Southeastern Missouri to points in Louisiana, Texas and Oklahoma.

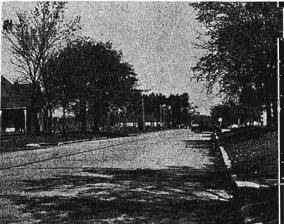

Inter-state travel has been facilitated considerably through completion of paving projects on Highway 71 between Texarkana and Waldron. This trunk line has been completed through the State, excepting 13.7 miles from Hatton to Mena, now in construction status, and 8.5 miles at the Louisiana line.

Recreational Highways—Recognition was taken of the importance of recreational and tourist travel when a law was enacted placing all roads leading to State parks on the State highway system. During the past two years 49 miles of such highways were built or improved on the roads leading into State parks at Paragould, Devil's Den, Lake Catherine and Petit Jean Mountain.

Farm-to-Market Roads—During 1936, Congress passed an act providing for the establishment of a Federal system of secondary or feeder roads, the total mileage of which should not exceed ten per cent of the total highway mileage of the State. Although this system has not been completely designated for Arkansas, Federal funds were alloted for interim projects and during the biennium, 86 miles of such roads were constructed in various parts of the State at a cost of \$620,785.

Urban Routes—An urban route of greatest need was built through the city of Conway. This project consisted of 3.185 miles of four-lane concrete pavement through an

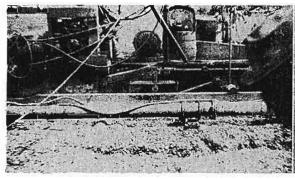

Old Route New Route
Urban Trunklines Seek to Avoid Overcrowded Streets

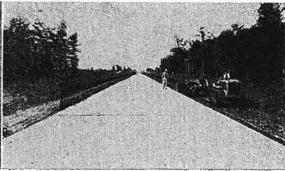

undeveloped residential section of the city, to supplant the old route of U. S. Highways 64 and 65 that projected through the business district. The completion of this work eliminated one of the most hampering "bottlenecks" within the State. The old and the new conditions of traffic are shown by the two pictures on the opposite page. Traffic routing through Little Rock was greatly facilitated by construction of a modern viaduct and approaches over the Rock Island and Missouri Pacific Railroad tracks on Asher Avenue. This was opened to traffic in November, 1940.

Projects Involving New Methods—Progress in highway construction demands the utilization of new and improved methods which result in economy and improved service. The most sizeable project employing new methods of construction during the biennium was the Winchester-McGehee job, 12.456 miles of concrete pavement costing \$294,067.24.

The new method here included internal vibration in the concrete, induced by use of a transverse vibratory tube operating in addition to the tamp and trowelling screeds of the finishing machines. The function of such a tube was to cause the coarser particles of aggregate to get closer together so as to reduce void space and, in turn, to require less mortar per unit of volume.

This method permitted adoption of specifications requiring five sacks of cement per cubic yard of concrete in lieu of the standard specifications which required $5\frac{1}{2}$ sacks per cubic yard. Since 30,774 cubic yards of concrete were used in the pavement, 15,387 sacks of cement were saved, reflecting a monetary value of approximately \$9,232.00. The following pictures illustrate the vibratory methods used and a section of the complete pavement which is regarded as highly satisfactory.

Vibrator in Action

Finished Pavement

Economy by Improved Construction Methods

A research project was also carried on in connection with the above paving project in an effort to determine the possibility of obtaining longer life and more improved service from concrete pavements that are placed over the highly expansive and unstable soils that are typical of the delta portion of the State. Concrete pavements placed over this type of soil frequently warp and crack and under heavy traffic settle and break up seriously. Traveling over such sections is uncomfortable and hazardous, and often the pavement must be replaced long before its life expectancy is reached. The maintenance on pavements after they have once become warped and broken is very costly. The unequal volume changes in the subgrade, caused by varying moisture conditions, is the chief factor responsible for such behavior.

The length of this research project was 4,800 feet, beginning 0.4 miles south of the highway intersection at Winchester and ending 9.5 miles north of the highway intersection at McGehee. This location was selected because the soil was all identical and was also the most unstable on the entire project. The section was an A-7 clay by texture and a fragmentary shot by structure, with a colloid content of 60%, a liquid limit of 90, and a plasticity index of 60. The test section was divided into four 1,200' sections as follows: On the first section a uniform nine inch pavement with contraction joints was constructed, thus increasing the beam strength over the normal thickness used; on the

second and third sections liquid asphalt and asphaltic cement were used on the respective sections for making an impervious asphaltic membrane under the pavement, thereby maintaining a more uniform moisture distribution and uniform volume of the soil; on the fourth section a one foot layer of permeable non-expansive selected soil was placed directly under the pavement to encourage a more uniform moisture condition in the clay soil of the roadway. All data and observations have been assembled and recorded in such manner as to make it possible to study, evaluate, and compare the results obtained from the various treatments.

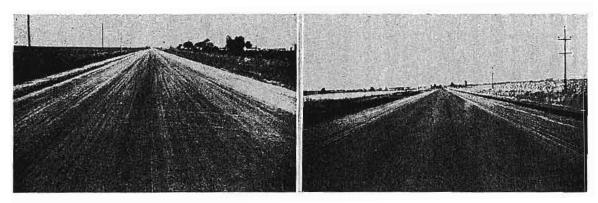

During the past two years soil stabilization work has attracted considerable attention throughout the country and our State has kept abreast of the times through the construction of several miles of soil-cement mixtures and of bituminous stabilized bases.

Although these new construction methods are still somewhat experimental we consider that Arkansas has made worthwhile contribution to the development of this type of construction which is beginning to be generally recognized as highly satisfactory and practical for certain types of soil and conditions.

Briefly, these construction methods provide for the application of asphalt or cement to the existing soils and, through rigid control of processing and manipulation, to secure a stabilized base of desired depth on which is placed a bituminous surface treatment.

These construction features have the obvious and important advantage of requiring only a minimum of construction materials since the existing soils generally comprise about 90 per cent of the volume, thus making it necessary to bring in only the cement or asphalt. It is readily seen, therefore, that these construction methods are particularly adaptable to projects with suitable soils for mixing with asphalt or cement, where no gravel or crushed stone material deposits are available for the customary base construction.

The pictures shown are an Arkansas County project showing the finished base and a view of the completed road with bituminous surface course and shoulders.

Base Ready For Surface

Completed Surface

Summary—The mileage, type and location of all road construction accomplished during the past two years is shown by Table No. 4, while construction by routes and Congressional Districts is tabulated in Tables 21, 22, and 23 in the Appendix.

BRIDGE CONSTRUCTION

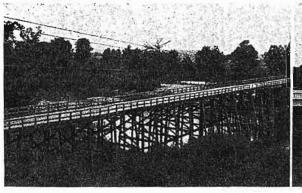

Bridges are the most costly per lineal foot of any improvements made on the public highways. They are also the most fifficult to move or modify after completion. Since this is true there is necessity for great care in their planning. The most permanent types are most economical over a period of years, therefore, where funds are available these types are used unless there is probability of a change in location or marked change in volume of traffic. All pertinent factors should be considered in the preparation of plans.

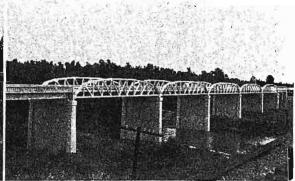

Increased economy of construction has been made possible in recent years because of improved available materials, better construction methods, and more accurate design due to increased scientific knowledge of the behavior of steel and concrete in structures. In spite of the marked increase in widths of roadway due to increased volume and speed of traffic, and more rigid requirements in quality of workmanship, the cost per lineal foot of bridge has remained practically constant during this biennium.

Inadequate Structures

There still remain on our State highwa/ system numerous bridges which have inadequate widths or carrying capacities. With the speeds which now prevail, safety dictates that bridges should be planned for at least two lanes of traffic and the widths of roadway should be at least four feet greater than the paved surface leading to them.

Heavy hauling has also increased until loads of 12 or 15 tons and even heavier are of common occurrence. Obviously our old bridges are not safe for these loads. Fifty inadequate bridges and six inadequate grad; separation structures were replaced during the biennium. There is real need for the replacement of those that remain.

Old St. Francis Bay Bridge, Route 64, hetween New St. Francis Bay Bridge. Total length, 1,696 Parkin and Wynne. High water completely submerged this structure.

Inadequate Structures Must Be Replaced

Design

The design of bridges is continually being modified because of the availibility of new materials, the relative costs of various materials and labor, and the continued research which is being carried on to furnish designers more accurate information about the behavior of structures under traffic. Continuous beam and truss spans are now being used where formerly simple spans were used. Better and more uniform grades of material are being manufactured which permits the use of higher unit stresses in design. Deck spans in which the roadway is unobstructed by overhead bracing are used to a greater extent than formerly. Less danger to life and less likelihood of damage to the structure are thereby achieved.

It has been customary in this organization to use local materials wherever the costs do not involve a definite financial loss to the State. For this reason concrete structures have been given preference over steel.

Effort is exerted in all cases to provide pleasing lines and proportions to our bridges. Each design is proportioned to fit the conditions found at each bridge location.

Construction During Biennium

As in the case of road construction, all bridge structures built must be financed with Federal funds. In the biennium July 1, 1938 to June 30, 1940, 64 bridges with a total length of 11,698 feet and 13 grade separation structures with a total length of 4,126 feet have been placed under contract. All grade separation projects were built with Grade Crossing Elimination funds.

The plans for all bridge structures are prepared in the drafting room of the Bridge Division, and all construction work is supervised by resident engineers of this Division.

Among the more important bridges built during the biennium are the following:

- 1. St. Francis Bay bridge on Route 64, between Wynne and Parkin. It is built of concrete and steel, is 1,696 feet long, has a 26 foot roadway and sidewalks and cost \$192,601.78.
- 2. East Cadron Creek bridge on Route 65 north of Conway. It is built of concrete and steel, is 411 feet long, has a 24 foot roadway and cost \$54,373.08.
- 3. Fourche La Fave River bridge on Route 9 and 10 near Perryville. It is built of concrete and steel, is 630 feet long, has a 26 foot roadway with sidewalks and cost \$69,505.58.
- 4. Eleven Points River bridge (not complete) on Route 62 west of Pocahontas. It is built of concrete and steel, is 1,215 feet long, has a 26 foot roadway and sidewalks and will cost \$121,360.00.
- 5. Among the notable old bridges replaced is the old covered bridge over Two Bayou on Route 79 near Camden. The new bridge is of concrete and steel, is 322 feet long, has a 26 foot roadway with sidewalks and cost \$23,914.40.

Among the more important grade separation projects built are the following:

- 1. Overpass on the Missouri Pacific Railroad tracks and underpass on the Cotton Belt Railroad tracks at Texarkana on Route 71 (not complete). They are built of concrete and steel, with a length of 739 feet. The roadway is 40 feet with dividing strip and sidewalks. The cost is \$164,429.58 for structures alone.
- 2. Under construction but not completed at the end of the biennium are the overpasses on Asher Avenue and on Arch Street in Little Rock, the former to cost \$93,574.00 and the latter to cost \$98,745.00.

The following tabulations briefly summarize the bridge and grade crossing structure program undertaken during the past two years. It should be noted that 77 structures having a combined length of 15,823 feet were constructed, or are under construction at an anticipated cost of \$1,671,828.

Cost of Bridge and Grade Crossing Structures Contracts awarded July 1, 1938, to July 1, 1940

	lo. of ridges	Lin. Ft.	Cost Per Lin, Ft,	Total Cost
Steel Bridges	1	222.42	\$ 43.43	\$ 9,661,26
Concrete Bridges	11	1,182,68	111.82	132,246.54
Steel and Concrete Bridges		7,860.19	102.14	802,800.89
Concrete Overpasses		916.14	122.63	112,378.25
Steel and Concrete Overpasses		3,209.55	132.25	424,462,43
Timber Bridges		2,432.45	35.30	85,869.14
Steel and Concrete Underpasses				104,409.75
Total Less Underpasses	73	15,823.70	99.05	\$1,567.418.51
Grand Total	77			\$1,671,828.26

The foregoing figures do not include the cost of the roadway approaches. On projects where construction has just started the cost is based on contract award plus expended and anticipated engineering expense. Projects well along but not complete are figured on the expenditure to date combined with the cost to complete, based on contract award, plus estimated engineering expense to date of completion.

Bridge and Grade Crossing Structures New and Replacement Distribution Contract awards July 1, 1938, to July 1, 1940

	No. Structures	Type	Lin. Ft.	Cost
Inadequate Bridges Replaced:	6	Concrete	710.34	\$ 81,874.94

•	4	Steel and concrete	1,666.96	219,673.34
Totals	77		15,823.70	\$1,671,828.26

TESTING OF MATERIALS

The service derived from highway construction depends not only upon the design of roads and bridges, but also upon the quality of the materials which form an integral part. Economy in construction also requires that materials adjacent or near the work to be used whenever the quantity and quality are adequate. These phases of highway construction are performed through the Division of Materials and Tests.

The principal activities of this Division may be divided into two general categories. The first is preliminary field investigation which includes soil surveys and the location and investigation of local material deposits that may be used economically in the construction and maintenance of highways. The second is the laboratory testing and field inspection of all materials to insure their suitability for use in the roadway or structure. Other activities include the testing of products resulting from the combination of materials such as concrete and asphalt mixtures, and the making of studies and tests of a research nature of the various types of construction that have been in service for some time to determine their service behavior.

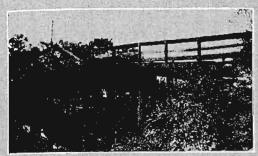

The development of highway construction during the past few years has increased the activities and functions of this Division. The realization that sub-grade soils are of utmost importance to the life of pavements and the actual use of stabilized soils in base course construction has expanded the work of soil testing. The demand for dustless surfaces has brought about the construction of many miles of low cost roads of this type. From year to year specifications have become more rigid, additional requirements have been added and a greater variety of materials used in construction.

Preliminary Field Investigations

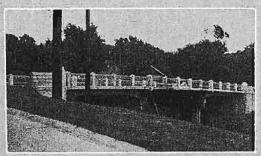

During the biennium field engineers of the Division have made soil surveys on all projects before construction. They have located, investigated, and secured options on 134 local stone and gravel deposits. Immediately after the location surveys were completed the field engineers made a thorough investigation of the sub-grade soils throughout the project and located all local materials available in the vicinity of the proposed work. Samples of the sub-grade soil and samples from the local material deposits were brought to the laboratory for test. The results of these investigations were transmitted to the Division of Plans and Surveys where they were used to determine the type and thickness of the proposed surface or pavement.

In some sections of the State where no local materials were available stabilized soil bases have been constructed. For these projects durability specimens were made up in the laboratory from a mixture of soil from the project and the stabilizing agent to determine the quantity of stabilizing material needed to obtain satisfactory results. The durability of such specimens was determined by alternate freezing and thawing, and alternate wetting and drying.

BRIDGE REPLACEMENT AND CONSTRUCTION

INADEQUATE TIMBER OVERPASS CROSSING FRISCO RAILROAD-

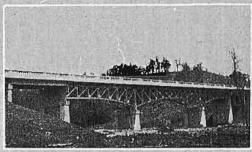

REPLACED WITH NEW CONCRETE STRUCTURE. LAFAYETTE STREET, FAYETTEVILLE.

OLD SUGAR CREEK BRIDGE, NORTH OF BELLA VISTA. NARROW ROADWAY AND SHARP CURVE.

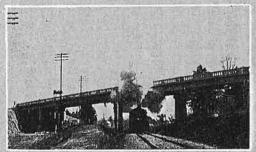

REPLACED BY NEW BRIDGE WITH 26' ROADWAY, AND SIDEWALKS.

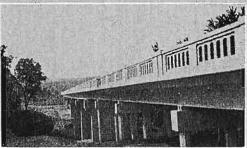

BRIDGE OVER EAST CADRON CREEK ON RELOCATED ROUTE 65, NORTH OF CONWAY.

IRONS FORK BRIDGE IN QUACHITA NATIONAL FOREST, ROUTE 27, NORTH OF MOUNT IDA.

COTTON BELT OVERPASS AT KINGSLAND ON ROUTE 79. 342' CONCRETE AND STEEL STRUCTURE.

FOURCHE LA FAVE BRIDGE-ROUTES 9 AND 10, NEAR PERRYVILLE 629 STRUCTURE REPLACING OLD INADEQUATE STEEL STRUCTURE.

Pre-construction Testing

The Highway Department maintains its own laboratory, and during the biennium made 12,192 separate tests on various materials used in construction and maintenance work.

	Number
Type of Material	of Tests
Asphalt	2,441
Cement	1,492
Steel	2,154
Soils	1,624
Gravel and Stone	426
Sand	320
Paint	166
Creosote Oil	30
Culvert Metal	95
Concrete Pipe	37
Water	38
Asphalt Mixtures	456
Concrete Cylinders	2,238
Concrete Cores	675
Total	12,192

Field inspections were made on approximately 2,250,000 cubic yards of sand, gravel and stone; 1,100,000 board feet of treated and untreated lumber; and 35,000 lineal feet of treated and untreated piling. In all instances, where feasible, materials were approved for use before being shipped. This was done by placing inspectors at the source of supply who sent the necessary samples to the laboratory for testing. On projects in which stabilized soil base and stabilized gravel base were used, small portable laboratories were maintained on the work. This was necessary for adequate control of materials.

Control Testing

Samples were taken on the job at regular intervals from the asphalt mixtures used and sent to the laboratory for extraction analysis. This was done to check the quantity and distribution of asphalt in the mixtures. Specimens for strength test cast on the job from the concrete used in all structures and pavements were sent to the laboratory to check the quality of the concrete. Cores were taken at regular intervals on all concrete pavement immediately after completion of the work and brought to the laboratory for test in order to check the thickness of the pavement before final payment was made to the contractor and further check the quality of the concrete. The Department owns and maintains a core drill machine for this work.

Service Testing

From time to time condition surveys have been made on existing road surfaces and pavements that have been in services for some time. Particular attention is paid to failures in an attempt to determine their causes. These surveys have been correlated with test reports on file. Samples from the roadway are often taken and brought to the laboratory for study and analysis. This information is utilized for the consideration of future changes in design and specifications.

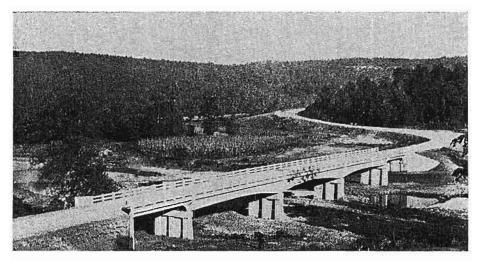

SECTION III

MAINTENANCE AND BETTERMENT

A major activity of the State Highway Department is that of maintaining the State's system of highways and related facilities as nearly as funds will permit in their original condition as constructed and the operation of these traffic services to provide satisfactory and safe highway transportation.

CONDITIONS AND PROBLEMS

Revenue—Act No. 11, Extraordinary Session of 1934, provided that, after deducting collection costs and county turnback, twenty-five percent of the revenue derived from motor vehicle licenses and gasoline tax shall be set aside to pay the cost of operating and maintaining the highway system. This cost includes, besides the actual road maintenance costs, administrative expense, equipment purchases, investment in buildings, traffic and safety control operations, and other work necessary for the proper functioning of the Department. Under this provision \$3,006,272 was derived for the maintenance account during the fiscal year ending June 30, 1939, and \$3,327,610 during the fiscal year ending June 30, 1940.

Protecting our Highway Investment Requires Adequate Maintenance

Funds Inadequate—While these sums were sufficient to provide for the ordinary day by day routine maintenance they were wholly inadequate to meet the demands for necessary replacements and renewals on both surfacing and structures. Hundreds of miles of gravel and low-cost bituminous surfaces are now carrying traffic which has doubled or even tripled in volume since the surface was laid. A cumulative deterioration evident for several years has resulted in a critical situation which only increased maintenance funds can obviate.

The extraordinary repairs to our highways which are necessitated by freezing weather, floods, and storms are emergency activities which test the resources of the maintenance organization each spring and winter and which require large expenditures, the amount of which must be taken from maintenance funds. The winter of 1939-1940 was the most severe, from the standpoint of freezing and thawing damage, of any in the history of the Department. Many miles of bituminous surface roads were badly damaged and only through immediate concentration of maintenance activities on such sections was it possible to salvage the State's highway investment. These emergencies, which

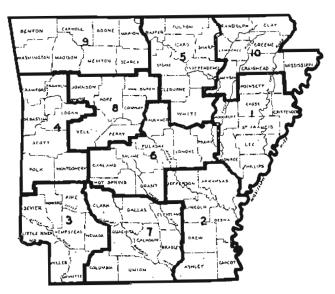

must necessarily be paid for out of regular maintenance funds, obviously restrict regular maintenance operations.

Recommendation—The imperative need for additional funds to protect our invest ment in highways presents a critical situation which it is hoped the current session of the legislature will find means to relieve. Careful and exhaustive studies indicate the need of an annual appropriation of \$5,000,000.00 to cover operating expense and to in sure maintenance and replacements that will conform to sound engineering practice and satisfy the public demand.

MAINTENANCE OPERATIONS

Organization—Successful prosecution of maintenance operations on the large mile age of State highways requires a carefully organized force of well-trained employees General administrative control of all maintenance activities is supervised by the Maintenance Engineer located in the central office at Little Rock. Direct maintenance control is effected through ten District Engineers, each of whom supervises the requisite office, shop and field personnel in his respective district. Routine maintenance operations are carried on by section foremen or patrolmen and their crews, which, during the biennium, averaged about one thousand workers. Special maintenance, or work requiring specific authorization, is undertaken, in part, under the direction of the District Engineers. Regular "section" crews are used in some instances, though more often this group is used as a nucleus of the much larger crew required on the more extensive projects.

In order to effect economy and efficiency, certain specialized maintenance operations are controlled entirely through the central office. These include the specially trained traveling crews engaged in mud-jacking, center-striping, magnet truck activities, and special bridge maintenance for extraordinary or skilled bridge maintenance work.

Map Showing Highway Maintenance Districts

Extent of Operations—The magnitude of maintenance activities is measured not only in terms of the total highway mileage, but also by the type of road surfacing involved. During the past four years the State Highway System has been increased by 146 miles, making a total of 9,289.3 miles of highways now under maintenance. The following tabulation indicates the miles and percent according to surface type; it should be noted that two-thirds of the total mileage has gravel or lower type which requires a higher annual up-keep cost per mile.

Mileage State Highway System

Type Surface	\mathbf{Miles}	$\operatorname{Percent}$
Concrete Pavement	1,242.7	13.4
Asphaltic Pavement	486.8	5.3
Low Cost Bituminous Surfacing	1,357.1	14.6
Gravel	5,575.8	60.0
Graded and Drained	465.4	5.0
Unimproved	161.5	1.7
Total Maintained	9.289.3	100.0

District Operations—Funds for road maintenance are allotted monthly to the ten maintenance districts, and apportionments are based upon the mileage of highways, type of highways and the volume of traffic. It is the responsibility of the District Engineer to see that expenditures are kept within the monthly budget allotment. Although maintenance expenditures are shown in detail in Table No. 13, Section VI, the following information shows the expenditures by districts, together with the highway mileage in each district as of November 1, 1940:

TABLE 5

	Highway	Expenditure				
District	Mileage		1938-39		1939-40	
1	$990.\overline{7}$	\$	259,674.43	\$	269,946.12	
2	973.9	-	238,534.97		245,371.91	
3	791.0		209,534.17		180,238.37	
4	723.1		208,130.26		169,023.32	
5	890.0		210,801.59		191,086.79	
6	969.1		207,377.40		205.514.92	
7	908.4		213,477.04		218,160.42	
8	819.3		225,413.20		179,516.08	
9	1,216.6		238,719.59		243,444.27	
10	1,007.2		243,365.35		247,089.85	
Totals	9,289.3	\$2	2,255,027.98	\$2	2,149,392.05	

The expenditures shown in Table 5 include, in addition to the regular road and section charges, extraordinary maintenance, district general expense, mud-jacking, centerstriping, central shop expenses, and the cost of district buildings. Administrative cost, special highway improvements, purchases of equipment and claims, items 1, 2, 4, 5 and 6, Table 13, are not included in district expenditures.

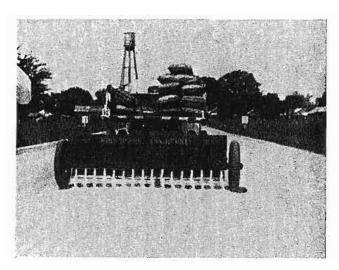

Objectives and Practices

Standard Methods—In order to effect all possible saving, the policy of the maintenance organization during the biennium has been to standardize, insofar as possible, not only all mechanical operations, but the type of equipment and the kind of materials used. Accordingly, close supervision is exercised at all times over each maintenance function. Instructions, prepared and issued by the central office, have resulted in marked uniformity of practice as well as in more satisfactory relations with the traveling public.

Economy Through Improvement—The cost of maintaining untreated surfaces such as gravel, because of the constant attention required, is necessarily high and, as a result, the largest items of maintenance expense during the biennium were for the replacement and repair of gravel surfaces. In an effort to alleviate this condition and, at the same time, to meet the demand for dustless surfaces, considerable attention has been given to the stabilization of gravel surfaces through the use of oil or other materials. Notwithstanding the fact that stabilization of gravel surfaces results in a substantial saving in annual maintenance costs, funds have not been available for more than a limited mileage of this type of work.

Dust Palliatives and Stabilizers—During the past year numerous "test" sections were treated with calcium chloride to determine efficiency of this agent as a dust palliative on gravel surface roads. Approximately thirty sections of road in seven of the ten maintenance districts were so treated, and subsequent inspection showed considerable range in effectiveness resulting from variation in the amount of binder soil present to

effect consolidation of the surface. In several sections of the State gravel roads were treated with cut-back asphalt as a dust palliative and stabilizer. The results obtained by these applications were very satisfactory and the cost was reasonable. In addition, approximately 240 miles of bituminous road; were given asphalt seal coats during 1939.

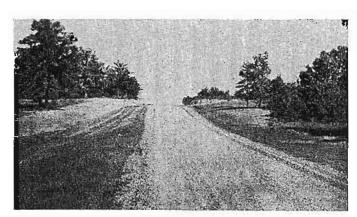

Calcium Chloride Answers the Dust Menance

Shoulders and Slopes-Highway shoulders have been markedly improved during the past two years. Where formerly practically all our highway shoulders were of earth only, there are now many miles of stabilized gravel shoulders which present a more pleasing appearance as well as a safe emergency roadway. Rutted shoulders on the inside of curves along paved highways have been a frequent cause of accidents. In order to relieve this condition the Maintenance Division is now placing a strip of bituminous material from two to three feet wide at the edge of the pavement on some of the more hazardous sections. This treatment materially reduces subsequent maintenance costs.

Considerable work has also been done in the shaping of shoulders, and flattening of slopes and back slopes to increase sight distances. A specific example of such work is noted on U. S. Highways 67 and 70 south of Little Rock and west of Benton. With a three-man crew, a bull-dozer machine and a No. 10 motor patrol, excellent results were accomplished at a very reasonable cost. This work has materially increased the safe speed at which traffic can move over these sections.

Safety—Much progress has been made in the installation of reflectorized signs during the biennium in an effort to modernize our highway marking. Guard posts with reflector buttons have been placed on many high fills and sharp curves on the main highways. Many miles of speed zones signs have been erected. This work, which is now directed by the Division of Traffic and Safety, is described in detail in Section IV.

Roadsides--Roadside I a n d scaping and erosion control have received considerable attention during the past two years, and work is being done as rapidly as funds will permit. Pictures are included showing a section of Highway 25 in Greene County where this type of work was done in cooperation with the Soil Conservation Service of the U.S. Department of Agriculture. A special effort is being taken to trim trees anl cut away undergrowth which tends to obstruct the motorist's view on sharp curves and intersections. On many of our mountainous routes trees are also being cut or trimmed at special vantage

Erosion Control Reduces Maintenance and Increases Safety

points that offer unusual scenic attraction.

Bridges—A traveling crew performs the specialized operations necessary for the upkeep of all large bridges. Such maintenance work includes painting, floor repairs,

steel repairs, concrete work and the placing of load limit and warning signs on inade-

quate or narrow bridges.

One of the largest bridge projects completed this year was the placing of a concrete deck on the Arkansas River bridge on Highway 64 between Fort Smith and Van Buren. The work was accomplished as a W.P. A. project jointly sponsored by the Bridge District and the Highway Department.

Meeting the Demand for Increased Safety

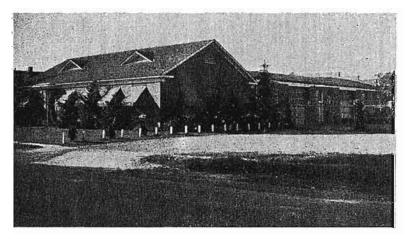

Materials — Asphalt pre-mix material is now being produced in several districts by maintenance forces, either with a small asphalt plant or by the use of portable mixers, which are moved from one location to another. This method has considerably reduced the unit cost of pre-mix bituminous material used for patching work. This material was formerly shipped from the Central Asphalt Plant in North Little Rock and the saving on freight alone has been considerable. Insofar as possible, future demands for various mater-

ials are anticipated in order to effect all possible economy through large purchases.

Buildings—In an effort to obtain more adequate facilities and avoid the inconvenience and cost of renting, the Maintenance Division is constructing shop and office buildings in the ten districts as rapidly as finances will permit. A new shop and office building for District No. 1 at Wynne has rejently been completed in cooperation with the W. P. A., and is now occupied by the district forces. Modern office and shop buildings have now been constructed in six of the ten districts as follows:

District No. 1 Wynne
District No. 2 Pine Bluff
District No. 3 Hope
District No. 4 Fort Smith
District No. 5 Batesville
District No. 10 Paragould

Application has been made to the W. P. A. for Federal funds to assist in the construction of similar buildings in the other four districts.

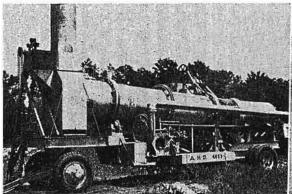

Adequate Facilities Improve Maintenance Operations
District Headquarters Paragould

MAINTENANCE OF EQUIPMENT

Facilities—The servicing, repair and replacement of the equipment necessary for highway maintenance represents a major activity within itself. This work is performed under the direction of the Equipment Supervisor, and is accomplished through a central shop at Little Rock and the ten district shops. The central shop is completely equipped, including a general repair shop, machine shop, blacksmith shop, woodworking shop, and sign shop. With these facilities, all equipment repairs, from the most minor to complete overhauling, can be done with State forces. Similarly, each district has its own shop where all ordinary repairs to district equipment are made. In the case of major repairs or complete overhauling, heavy duty trucks and trailers transport such equipment to the central shop where more complete facilities and services are available. Funds for equipment repair have been limited to approximately \$38,000 per month.

Construction of Special Equipment—Many pieces of highway maintenance equipment are designed and constructed in the central shops at a considerable saving to the Department. The magnet truck pictured is typical of such work. These magnet trucks are of the automatic type operated by hydraulic control from the cab, and, including the cost of the truck, were assembled at a total cost of \$2,900 each. All center stripe machines in use were also designed and built by the shop forces. The accompanying picture shows a portable self-feeding material dryer designed and constructed during the past year. This piece of equipment is for operation in connection with a portable bituminous mixer, and was constructed in large part from salvaged and discarded materials.

Equipment Built in Central Shops

Material Dryer and Magnet Truck

Parts and Supplies—Requisitions for all equipment, parts and supplies are made out and approved by the head of each Division or Maintenance District. All requisitions are then transmitted to the Central Office Purchasing Division where they are checked and the necessary purchase order issued. This procedure assures closer control of items purchased, especially with regard to uniform prices and distribution among vendors. However, small emergency items may be bought by the district office, but requisitions are required for approval and confirmation.

Insofar as possible, all materials bought are charged directly to the road section where used, all parts and repairs to the paricular item of equipment under repair, and all supplies direct to the district requisitioning them. Where this is impossible, items are charged directly to the Central Shop stock account or to the shop stock account of the maintenance district.

Inventory—A difficult problem of the Maintenance Division has been the replace ment of worn out and obsclete equipment. Heretofore, no special "equipment fund" was available and when necessity forced the purchase of a particular item the entire cost was immediately charged against the district where the equipment was placed in operation. Under the accounting plan put in operation during the last half of the biennium it is contemplated that a reserve equipment fund will be set up from which all new equipment will be purchased. This sinking fund will be reimbursed for such purchases by crediting it with rental charges levied on the equipment according to the time used. Such rental charges will be designed to cover the actual depreciation and repairs during the

service life of the equipment so that when replacement becomes necessary the funds will be available for immediate purchase. This plan will place the Highway Commission's operations on established and recognized business principles that are essential to a prop-

er control of the inventory as well as the distribution of operating costs.

The gradual change in surface type from graded or graveled roads to bituminous or concrete surfaces, together with improvements in maintenance practice, necessarily required changes in the type of equipment purchased for replacements. During the biennium new equipment was purchased in the amount of \$350,800, however, due to the lack of sufficient funds, much obsolete equipment is still on hand. A summary of equipment on hand at the close of the biennium, according to general types with estimated value, is as follows:

90 Pull-type road graders	\$ 14,108
204 One-man motor patrols	150,463
95 Crawler type tractors.	53,735
9 Wheel type tractors	1,610
129 Automobiles	50,161
63 Half-ton pick-up trucks	18,898
43 Express or station wagons	10,135
522 1½ to 7 ton trucks	247,650
425 Items of miscellaneous equipment	208,753
Sub-total	\$755,513
Miscellaneous shop equipment	36,235
Total inventory	\$791,748

Excluding \$86,000 shown in the Thirteenth Biennial Report for surveying instruments and laboratory equipment, the present inventory shows an increase in the value of maintenance equipment of \$123,458.

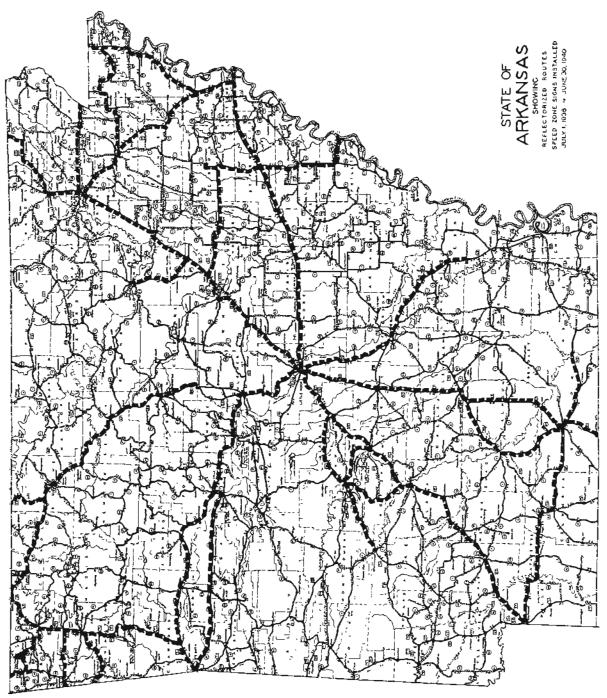

EXHIBIT NO. 8

SECTION IV

TRAFFIC CONTROL AND SAFETY

"The chief problem of highway departments is transportation. Accidents and congestion are indexes of the inefficiency of that free wheel transportation system." Awareness of that principle and concept led to the establishment of a traffic division in the Arkansas State Highway Department five years ago. The early activities were confined to traffic safety education through cooperation with schools and civic organizations, promotion of safety among employees and travel promotion and road information service. The division, now called the "Traffic and Safety Division," is charged with five clearly defined functions, all except one of which may be classified as traffic engineering functions. These activities will be described under the following five-fold classifications:

1. Traffic engineering activities.

Traffic safety education, public and employee.

State accident reports and statistics.

Traffic laws and regulation and enforcement of loading regulations.

Road information service.

The design and construction of highways and highway structures have been strongly influenced by principles of safety for a number of years. Study of transportation facilities are now made from the viewpoint of the highway user and these studies are bringing new concepts of design standards for the safe and expeditious movement of traffic.

This changing concept is also expressed in the reorganization of highway departments in most states by an evolutionary process which has resulted in the emergence of a new division, usually termed a traffic engineering division or division of traffic and safety. All functions relating to traffic control and traffic and employee safety are concentrated in this new section of the modern highway department. These functions are supervised by men who are technically trained in the application of specialized engineering principles to all problems relating to traffic and safety. The nature of the activities of this division are such that they impinge upon all other divisions of the State Highway Department, as proper standards for safety and traffic control are maintained.

A more adequate understanding of these activities may be had from a study of the

functions and reports hereafter described.

TRAFFIC ENGINEERING ACTIVITIES

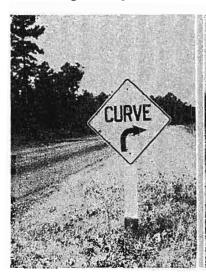

The recognized functions of a traffic engineering division include, in addition to strictly traffic engineering activities, such functions as traffic safety education, the gathering and analysis of facts from accident reports, and traffic laws and regulations, but for convenience in this report the various activities of these catagories are presented separately. Items to be presented under this topic include:

1. Standards for traffic control devices.

- Traffic engineering surveys and investigat
 Report of signing and marking operations. Traffic engineering surveys and investigations.
- 4. Center stripe and other traffic services.

Standards For Traffic Control Devices

A fundamental traffic engineering function is the design of traffic control equipment. Signs of all kinds, markers, traffic signal equipment and such items as the design and use of reflectorized guard posts, bridge wing posts, and culvert markers must all be made and specifications for their use promulgated. There have been three marked changes within the past five years even in the design of curve and turn signs. The accompanying pictures indicate the old style curve sign which carried the word "curve" and a small symbol. The sign could not be read very far. Four years ago the design was changed to what then was considered standard, using the symbol type but the dimensions of the bent arrow were not very large. Subsequent tests revealed that a symbol type sign with a much heavier stroke was more effective, and was necessary for modern high speed traffic. Since signs were of greater importance at night than during the daytime, standards were also revised to include reflector buttons. Curve and turn signs on all trunk or high speed routes are now of the design illustrated on the right. This design was perfected two years ago.

Other standards were similarly changed, so that symbol type reflectorized signs are used wherever possible. Practically all designs have now been completed for a State sign manual and it is expected that writing of accompanying specifications will be finished and the manual released by January 1, 1941.

Traffic Engineering Surveys and Investigations

Traffic engineering surveys most commonly used during the past biennium include:

- a. Speed zoning surveys.
- b. Speed checks.
- c. Turning movement surveys.
- d. No-passing zone surveys.
- e. Sign and marker surveys.
- f. Traffic engineering investigations.
 - (1) Local surveys.
 - (2) Study of accident and other locations.

Speed Zoning Surveys — Surveys to determine the practical safe speed of curves and turns on all paved highways was begun in April, 1939. On June 30, 1940, such surveys had been completed on 2,290 miles. Speeds are determined in multiples of 5 mph. up to and including 50 mph. With the survey, turn signs are indicated for speeds of 30 mph. and less, while curve type signs are used for speeds of 35 mph. and higher. The appearance of curves and turns equipped as a result of these surveys is illustrated herewith. Careful studies of other factors are included in these surveys.

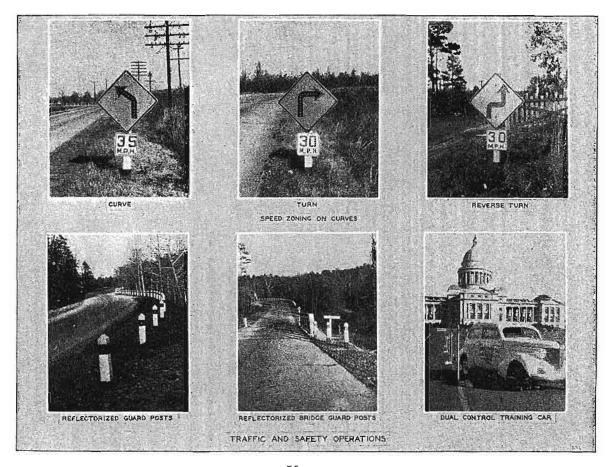

Speed Checks—Prevailing speeds of traffic are checked on "sample" curves and in other areas. This information is valuable in seeing that the posted speeds are valid.

Speed zoning around municipalities depends heavily upon knowledge obtained as to the prevailing speeds of traffic.

Turning Movement Surveys—Wherever there are turning movements there are traffic conflicts and as accidents occur at various locations, or municipalities request a study with a view of obtaining a permit to put in a traffic light, a careful study of the turning movements at such points is made. More than 25 such studies have been made during the biennium.

No-passing Zone Surveys—A program of marking no-passing zones on vertical curves was scheduled to begin in the spring of 1940, by which auxiliary or barrier stripes would be applied along the regular center stripe, such no-passing zones to be marked for at least 500 feet, depending somewhat upon the type of road and the design speed. Experimental surveys over a section of roadway were made but when tests were made on paints a further problem arose and during the year 1940 the Department had been making a study of various formulas of center stripe paint, in order to find types suitable and yet economical. The Director of Highways and the Chief Engineer have now approved standards for marking no-passing zones and improved center striping, in line with the standards recommended by the American Association of State Highway Officials. Plans are being perfected to begin this operation early in the spring of 1941. The plan calls for a solid black center stripe on concrete roads, a broken white stripe on blacktop roads, and no-passing zones to be indicated by auxiliary yellow stripes in the lane against which they are to serve as barriers.

Sign and Marker Surveys—During the summer of 1940 a survey of existing signs and markers in cities and at important junctions was launched, which is being carried forward into the next fiscal year. Efforts are made from these surveys to improve the signing so that strangers may have no difficulty finding their way. New standards for this purpose are being prepared.

Traffic Engineering Investigations—Investigations of this nature are of two types: (1) Those made at the request of a municipality, and (2) those made where accidents or congestion are known to, or are likely to occur.

- (1) At the request of various municipalities, traffic engineering investigations and surveys have been made in more than thirty cities, and towns, five of which were major surveys requiring several days each. Limited personnel has made it impossible to make more major surveys, for which there is a steadily increasing demand since no city in Arkansas has trained traffic enigneering personnel to do work of this nature. Parking, traffic lights, routing of traffic, problems adjacent to schools, speed regulations, and high accident locations are the chief types of investigations and studies made.
- (2) The division initiates many traffic engineering studies, most of which grow out of the information revealed by accident records. Condition and collision diagrams are made up where accidents are repeating or for other reasons, and from these studies remedial measures are devised. Forty-two traffic engineering investigations were made during the biennium, but detailed studies were not made in all cases. In a few instances islands have been designed and will be installed shortly in further efforts to control and regulate traffic.

Traffic volume surveys are carried on by the Division of Statistics and Analyses and traffic volume data are obtained from that division.

Report of Signing and Marking Operations

A program of installing reflectorized curve and turn signs was launched during the 1939 fiscal year, which has been carried forward practically simultaneously with special zoning. On June 30, 1940, marking of 2,242 miles of highway had been completed with reflectorized curve and turn signs. Speed zoning on the same date had been completed on 1,984 miles. In addition, approximately 75 miles of speed zoning approaching urban areas had been completed.

This signing program together with the installation of reflectorized guard posts and the various types of non-reflectorized signs and markers, represents an expenditure of \$103,867.65, of which \$36,450.81 was spent during the fiscal year ending June 30, 1939, and \$67,416.81 was spent during the year ending June 30, 1940. Items for which these funds were spent and the distribution of same by districts is indicated in Table No. 15, Section VI. It will be noted that during the two year period 10.863 reflectorized signs and 16.138 reflectorized guard posts of various types were erected. Exhibits No. 8 and No. 9 indicate the routes upon which the reflectorizing program has been carried out. Reflectorizing of curves and turns was 74.5 per cent complete and speed zoning on paved routes was 65.9 per cent complete on July 1, 1940.

Center Stripe and Other Traffic Services

Center stripe operations and operation of two magnet trucks to remove nails and other metal from gravel roads, have been carried on by the Maintenance Division, with cooperation of the Traffic and Safety Division. At the end of the present biennium these operations and the respective personnel were transferred to the Traffic and Safety Division, thus bringing together in this division all distinctly traffic service and safety functions, as distinguished from distinctly maintenance operations. A sign crew in each district handles matters of actual installation of signs and posts, but these operations have been under the close supervision of the Traffic and Safety Division for some time. The total expenditure for center-stripe operations during the biennium was \$22,-604.66. The average cost per mile of stripe was \$6.28. Expenditures for magnet truck operations were approximately \$5,800.00 for the biennium.

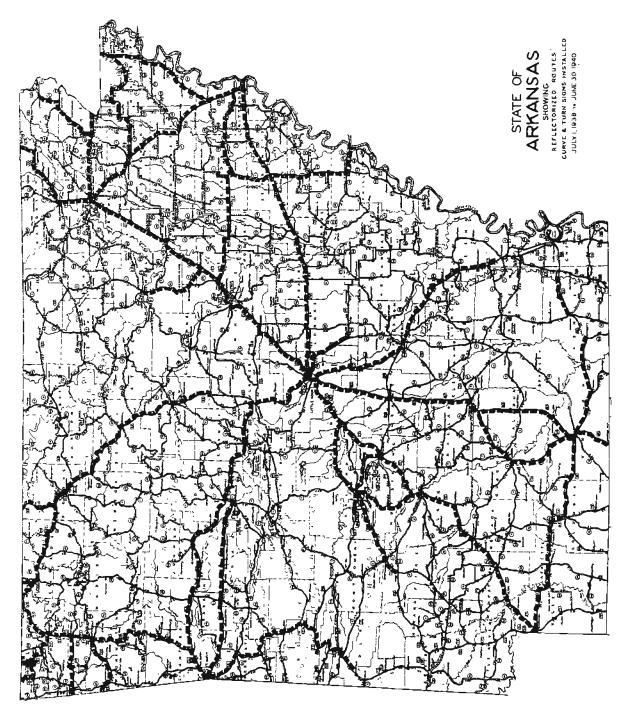

EXHIBIT NO. 9

TRAFFIC SAFETY EDUCATION, PUBLIC AND EMPLOYEE

Safety education activities have received much attention from the time the first safety work was launched by the State Highway Department five years ago. This has consisted of close cooperation with the schools and with civic clubs and other organizations.

Cooperation With Schools and Organizations

The first official plans and materials for traffic safety education in Arkansas high schools was prepared by the Traffic and Safety Division at the request of the State Department of Education, and released to the schools on April 11, 1936. It consisted of six units, designed for both classroom and assembly and included a bibliography of safety publications. The bulletin carried this significant paragraph:

"This material is sent you with the hope that it will enable you to clearly impress upon the minds of our young people the serious situation growing out of the increased operation of motor vehicles on our streets and highways, to the end that

the appalling traffic accident toll may be reduced."

The material also contained the suggestion that plans be made in the school next term to give some attention to safety education at all grade levels. The division has held many school meetings each year, with increasing assistance by counsel and by furnishing bulletins and helps to teachers and an illustrated handbook "Guide to Safe and Sane Driving" to schools in quantities for high school classes. The extent of these safety education activities in meetings of various types is indicated in the following tabulation. A substantial increase will be noted for the last year.

	1939 Fiscal Year		1940 Fiscal Year		Biennium	
Type of Meetings and Conference With Civil Clubs and Organizations With Schools With Teachers With Highway Department Employees	Number of Meetings 22 25 2 12	Attend- ance 1,396 7,495 465 810	Number of Meetings 55 99 18 15	Attend- ance 4,451 26,468 2,060 992	Number of Meetings 77 124 20 27	Attend- ance 5,847 33,963 2,525 1,802
Instruction Meetings with Commercial Fleet Drivers Safety Council Meetings and Conferences	6 21	330	11 37	305	17 58	635
Totals	88	10,496	235	34,276	323	44,772

Employee Safety

Some attention has been given each year to employee safety, including both shop or industrial safety and safety while working with traffic. Safety rules have been distributed and bulletins are prepared and distributed to employees periodically. Meeting with employees in the various districts and shops have been held as indicated in the preceding tabulation. This phase of the work has been greatly slighted, not through desire, but through necessity, and it is recommended that a safety inspector be added to the personnel of the Traffic and Safety Division, to devote all of his time to safety work among highway employees. Experience of other state highway departments and of industry generally indicate definitely that great savings would result from this small investment.

Public Education Activities

An extensive program of safety education designed to reach the public is carried on at all times. Weekly news releases to all papers of the State, radio programs, radiograms, distribution of safety literature and safety exhibits are used whenever possible. The extent of some of the activities for the biennium is indicated in the following tabulation:

Activity	Year Ending June 30, 1939	Year Ending June 30, 1940	Total for Biennium
Weekly news releases to 200 newspapers	•		
and periodicals	10,400	10,400	20,800
Radiograms to twelve Arkansas' stations	2,112	2,304	4,418
Radio safety programs	84	121	205
Safety exhibits	3	6	9

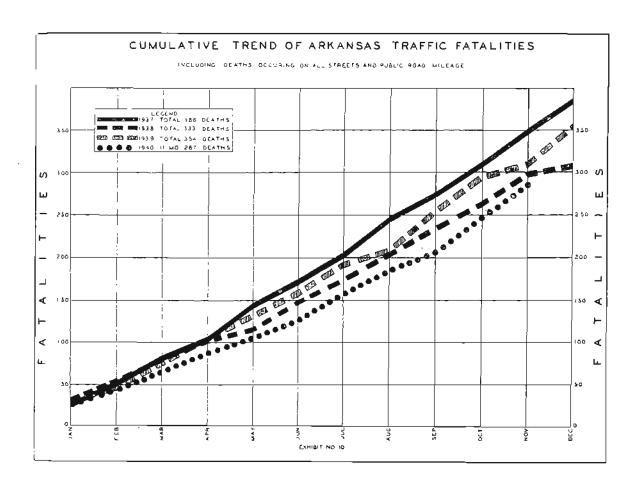

Training Program

From the time the State Highway Department initiated its safety activities it has been recognized that only specially trained, skilled personnel could effectively carry on a safety program. The supervisor has been given various short courses under national authorities and in turn this training has been passed on to employees of the division. In addition to the supervisor, three men from other divisions were sent to the University of Michigan in the summer of 1939, to take the course in Traffic Engineering by the staff of Yale University. Following completion of this course a course of study in "Principles of Traffic Engineering" was conducted by the supervisor as a part of the Department's "In-service" training program. Twenty-five highway employees attended the 30 hour course, twenty-one completing the class for credit. A similar course, but dealing with more detailed problems, will be offered highway employees during the 1940-41 fiscal year. A standard First Aid course was sponsored by the division in the spring of 1940. Twenty-two employees completed the course held in Little Rock.

A graduate fellowship in Traffic Engineering at Yale University was obtained for an employee, who completed the eight month's course with high honors and returned to his position as assistant traffic engineer June 1, 1940. Another employee is availing

himself of similar study during the present year.

The division participated in a college seminar for Driver Education and Training held at State Teachers College, Conway, in May. 1940, and the supervisor of the division was accredited as a teacher of driver training and also as an instructor to train other teachers. Adult driver training classes were started during the fall of 1940 and its is anticipated that these will contribute greatly to the advancement of safety education standards in the State. The Division cooperates extensively with the State Department of Education in meetings with teachers, and in other ways.

STATE ACCIDENT REPORTS AND STATISTICS

In 1913 only 1,892 motor vehicles were registered in Arkansas; in 1922 the total registration was 85,353; in 1927 the total passed the two hundred thousand vehicle mark, and, with the exception of the years 1931, 1932, and 1933, has continued to increase until the total registration for 1940 will exceed 265,000.

State Accident Reporting Bureau

One of the important operations of the Traffic and Safety Division is that of the State Accident Reporting Bureau, operated under a cooperative arrangement with the State Police Department. It was found that the State Highway Department could handle the analysis of accident reports more practically and economically and thus leave the State Police Department with more uniformed officers for duty on the highways where they are needed. Punch card record systems are used in this work and a modern filing and recording system was set up under the guidance of National Safety Council statisticians in the fall of 1937. Accident reports received, and information obtained from accident investigations made by the State Police Department are made available to the Traffic and Safety Division at frequent intervals, and in turn, the Division makes necessary information available to the State Police, the Department of Revenues, the State Department of Education, and the Arkansas State Safety Council. Detailed spot maps by counties are kept up to date and serve as the basis for many traffic engineering studies and investigations.

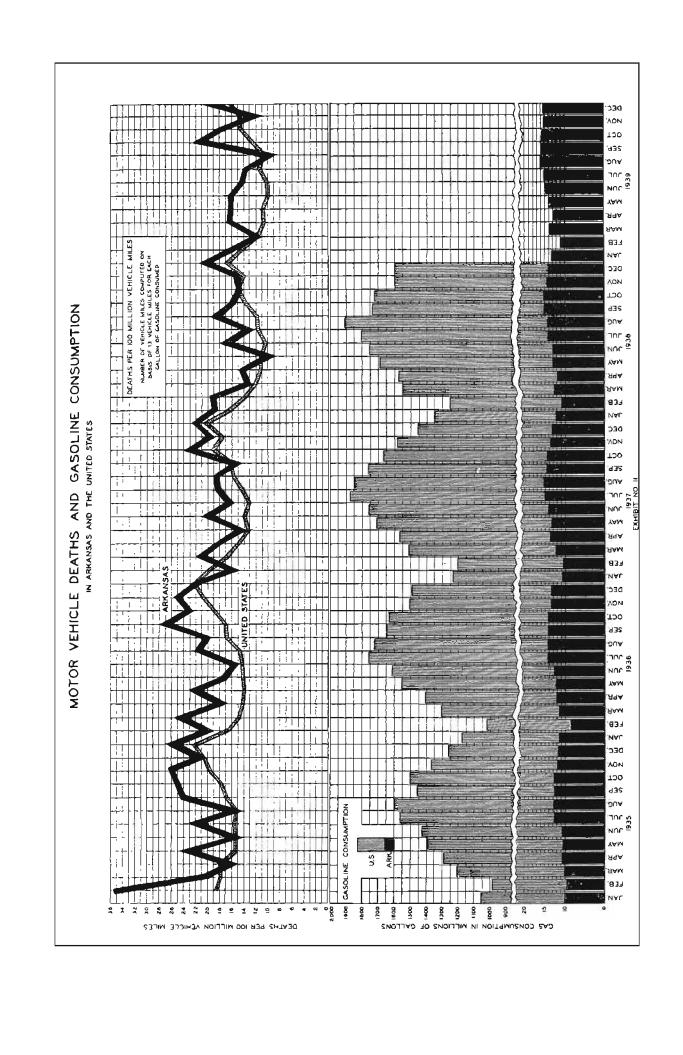

Accident Trends

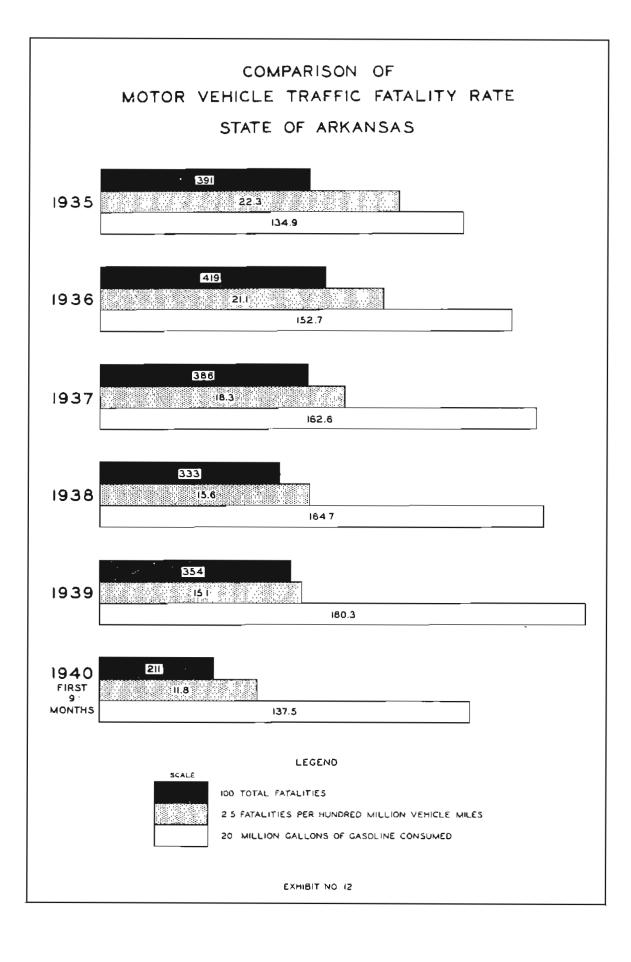

The effect of increased motor vehicle operation on accidents is reflected in the following tabulation in which fatal motor vehicle traffic accidents are indicated by months from 1934 through November, 1940. Exhibit No. 10 is a graphic presentation of the annual cumulative trends for the years indicated.

Fatal	Motor	Vehicle	Traffic	Accidents	Bv	Months.	1934	to	1940

Month	1934	1935	1936	1937	1938	1939	1940
January	26	45	29	22	30	27	23
February	18	25	27	29	27	17	19
March	24	20	25	29	22	30	20
April	24	32	34	26	22	28	24
May		20	27	35	16	31	24
June	30	30	25	29	29	28	16
July	28	24	40	35	24	28	29
August		40	37	37	35	20	28
September		41	50	29	31	45	28
October		43	42	43	30	36	34
November	30	32	44	34	29	24	42
December	32	39	39	38	38	40	
Total	347	391	419	386	333	354	287

Exhibit No. 11 shows the trends of gasoline consumption and motor vehicle traffic fatalities per 100,000,000 vehicle miles for Arkansas and for the United States for the periods indicated. Substantial reductions were made in the accident toll in 1937 and 1938. An increase of 6.3% was noted for the calendar year 1939 against an increase in vehicle miles of 9.5%. The first eleven months of 1940, from information available when this report went to press, showed a reduction over the preceding year. Exhibit No. 12 shows graphically the relationship between motor vehicle traffic fatalities per calendar year, annual gasoline consumption and the death rate per 100,000,000 motor vehicle miles, which is the standard used for comparative purposes. This exhibit is particularly significant in that the rate per 100,000,000 vehicle miles was 22.3 in 1935 and 15.1 in 1939 and for the first nine months of 1940 had dropped to 11.8.

Distribution of Motor Vehicle Traffic Fatalities By Counties

Exhibit No. 13 indicates the number of fatalities by counties for each year of the biennium together with the motor vehicle accident death rate per 100,000 population. Only 7 per cent of the vehicles involved in reported accidents in Arkansas were out-of-state vehicles.

Classification of Traffic Accidents

Accidents reported to the State Accident Reporting Bureau during the two years covered in this report are classified in various ways. Exhibit No. 14 and Table No. 25 in the appendix indicate the various types of accidents. Exhibit No. 15 is a bar-chart showing the relative percentages of primary causes of fatal accidents for the biennial period. It must be kept in mind that there are, on an average, nearly three causes for each accident, and many times it is largely a matter of personal opinion as to which is the primary and which the secondary cause. Removal of any one of the causes in most cases would have averted the accident.

Type of Vehicle Involved In Accident

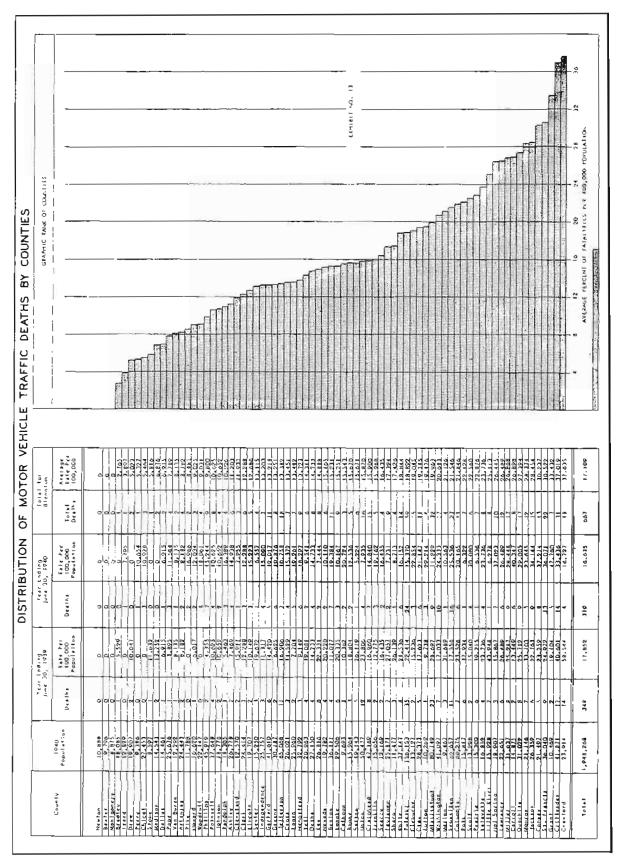

Table No. 24 in the appendix shows the type of vehicles involved in accidents during the period. It is noted that trucks and trailers, which comprise approximately 25% of the total vehicle registration in Arkansas, were involved in 27.77% of all reported accidents in 1939, and 34.85% of all fatal accidents. The record for trucks during the 1940 fiscal year shows improvement, but there is that same disparity with respect to the percentage of trucks involved in fatal accidents, which indicates that accidents involving trucks are more likely to be serious. Speed of trucks was reduced by legislative enactment during the period and this is probably reflected in the improved rate for the fiscal year ending June 30, 1940. Marked improvement in the record of highway department vehicles involved in accidents with their attendant claims has been noted since the safety program among employees was intensified early in the biennium.

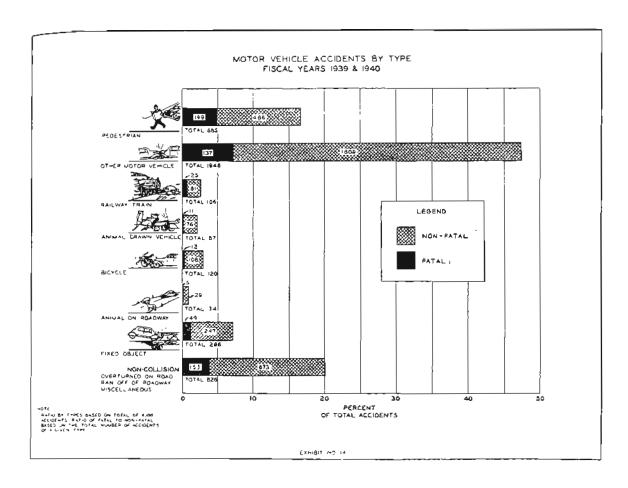

Time Of Accidents

The time when accidents occur is imporant for educational, enforcement and engineering purposes. A study of all reported accidents during the biennium with respect to time of occurrence is represented graphically in exhibit No. 16 and is detailed in Table No. 26. Although the vehicle miles accumulated during the hours of darkness are estimated to be approximately one-third of the vehicle miles accumulated in the daytime, a considerable majority of accidents occur at night. At certain seasons of the year nearly three-fourths of all fatal accidents on Arkansas' highways take place between sundown and sun up.

Spot Maps and Miscellaneous

Various other tables showing pertinent classifications are presented in the appendix, Nos. 27, 28, and 29. Exhibits No. 17 and No. 18 are accident spot maps for the calendar years 1938 and 1939, imposed on traffic flow maps, thus revealing the occurrence of accidents with respect to the density of traffic.

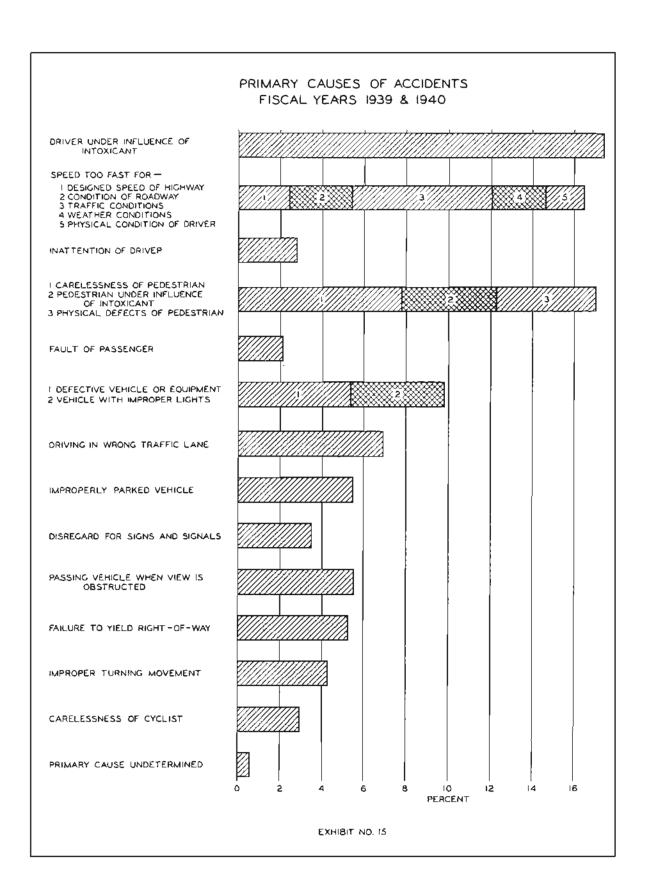

TRAFFIC LAWS AND REGULATIONS—ENFORCEMENT OF LOADING REGULATIONS

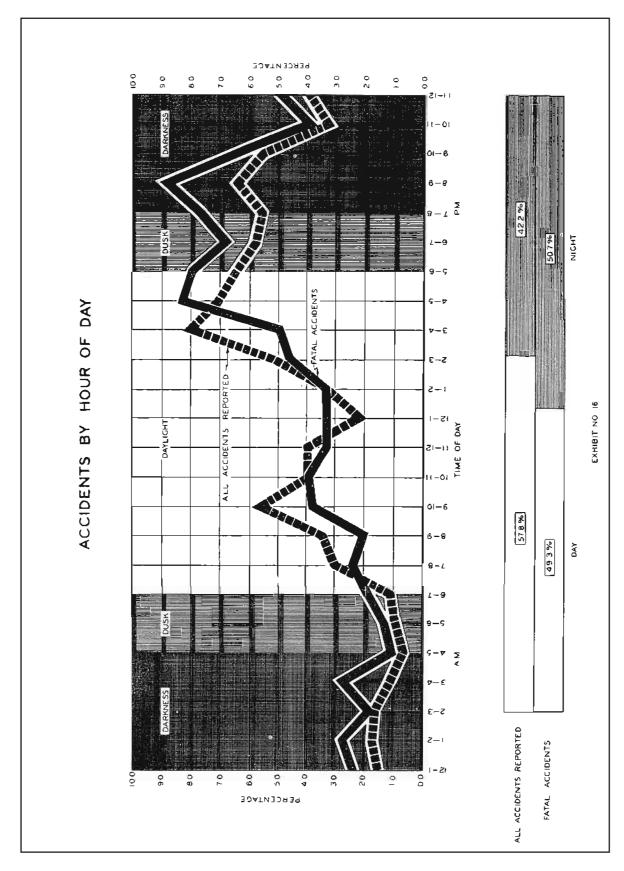

General

The Traffic and Safety Division is charged with matters pertaining to traffic laws and regulations. During the biennium the traffic laws were coded and published in booklet form for distribution to those who had need of them. In addition, an illustrated digest of the traffic laws was prepared and published under the title, "Guide to Sate and Sane Driving." This publication won high praise from National Safety Council authorities who declared the booklet was one of the best of its kind published by any state. Approximately 250,000 copies of the handbook have been distributed to schools, transportation and trucking companies, Civilian Conservation Corps and to many other organizations and individuals. Hundreds of direct inquiries are answered each year dealing with various phases of the traffic laws and the regulations of the Commission. The Division cooperated with the State Department of Education in the preparation of regulations for the operation and equipment of school busses. The Division also cooperates and advises with legislative committees on matters pertaining to traffic laws for the State and for cities as well.

Enforcement

Enforcement of traffic regulations with respect to trucking operations is a functions of this Division. Four men were assigned to this work in November, 1938, and at the end of the fiscal period, June 30, 1940, some twenty-five traffic inspectors or helpers and two field supervisors were assigned to this functions. During the month of January, 1939, overloads averaged more than 50 per cent of the vehicles checked each week. The number of men assigned to enforcement of loading regulations was

gradually increased and by the end of the biennium this percentage had been reduced to 6.75 per cent. The following tabulation indicates the scope of this activity:

	Fisca		
	1939	1940	Total
Trucks Inspected and Passed			
Without Weighing	16,499	113,179	129,678
Trucks Weighed	6,714	29,397	36,111
Trucks Found Overloaded	3,300	9,629	12,929
Trucks Unloaded	1.375	7,625	9,000
Average Per Cent of Overloads	14.22	6.75	7.80
Revenue Collected Per Week, Average			\$2,346.50

It is to be noted that these weight officers accounted for an average of \$2,346.50 per week of revenue (based on a reported total of \$96,206.40 for 41 weeks), practically all of which would have been lost to the State otherwise, since it was collected from those operating trucks illegally or violating permits granted to operators of vehicles registered in other states. The main purpose of this function, however, is for the protection of the huge investment made in Arkansas' highways, a service which cannot be easily measured in terms of dollars and cents, but which is none the less tangible.

Permits

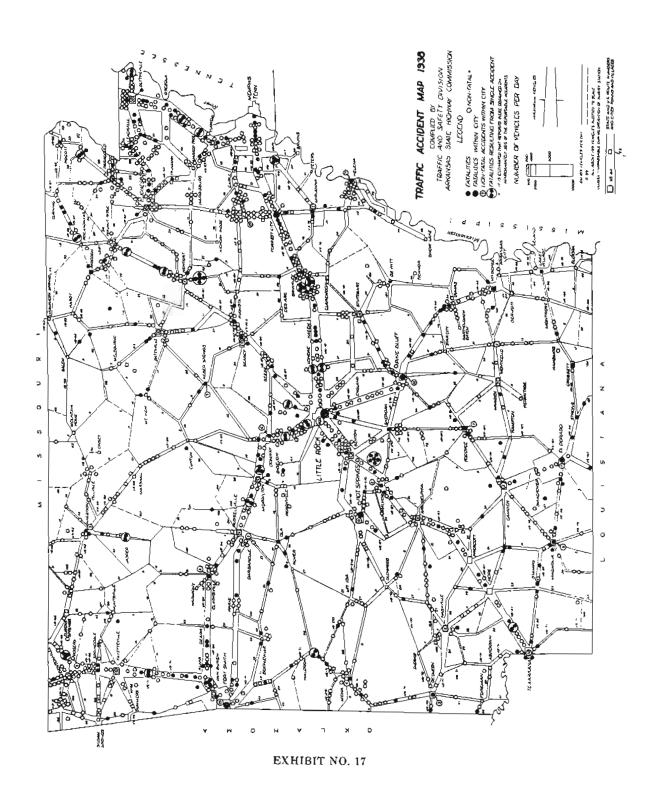

Another function of the Division in connection with traffic laws and regulations is the issuance of permit when it is necessary to move a load over the highways which exceeds legal dimensions. Permits will be issued when circumstances warrant for moving over-height, over-length or over-width loads with whatever special restrictions may be necessary for the protection of traffic. Generally such over-dimension loads may be moved only during daylight hours and the number of days for the operation are usually limited to four. No permits are issued for overloads, the Commission, by resolution, abolishing that practice which previously had been badly abused.

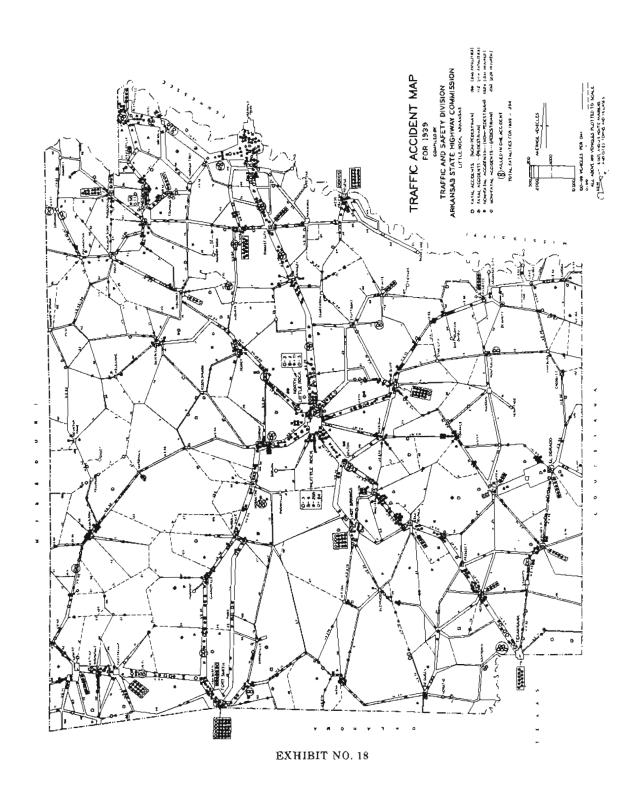

ROAD INFORMATION SERVICE

A function assigned to the Traffic and Safety Division which is not a traffic engineering activity is that of providing road information service to the many who inquire as to routings, points of interest and travel conditions or who must obtain that information from travel bureaus.

Many inquiries are answered by telephone and approximately 200 cards and letters requesting information or literature are answered each month. A weekly road condition report is prepared and mailed each Thursday to more than four hundred tour agencies, travel clubs, service stations, hotels and individuals. During winter months the Division, upon request, supplies daily wire service to important tour agencies which information in turn is relayed by radio to all parts of North America. During times of flood, or other hindrances to normal travel, the Division operates from eighteen to twenty-four hours per day in order to give full assistance to the traveling public.

The Division also handles details incident to the preparation of the highway service map for the year. From 75,000 to 100,000 maps are distributed each year, and, in addition, many thousands of pieces of literature, prepared by this and other departments of the State. The Division has published a small pamphlet entitled "One Hundred and One Points of Interest in Arkansas," which has proved exceedingly popular. Approximately 25,000 copies have been distributed during the biennium.

LOOKING FORWARD

The advancement in the activities and responsibilities of the Traffic and Safety Division during the past two years has been most marked, but actually it represents but a beginning, since there is so much traffic engineering and traffic safety work to be done before any great improvement in the traffic picture can be made. Dozens of cities and towns need our traffic engineering services, but our limited staff makes it impossible to meet more than a few of these requests. Traffic engineering functions are of much interest to all who use the streets and highways, and while many traffic engineering functions involve comparatively small expenditures, they loom large in the eyes of the traveling public. Traffic Engineering itself is a new and highly specialized type of engineering, a profession within itself, and when given proper recognition and administrative support can contribute much toward raising the standards of all divisions of the average highway department.

Completion of a state sign manual, further tests of center stripe paint preparatory to launching a modern striping program in the early spring of 1941, rebuilding of a striping machine for this purpose, sign and marker studies in all towns and at junctions with further progress toward uniformity of signs and markers in all districts, traffic engineering assistance to cities and towns to such extent as may be possible, expansion of the adult driver training program, continued cooperation with and assistance to schools and colleges of the State, an intensified program of public safety education, and a more adequate program of employee safety within the Department are some of the objectives for the next fiscal year.

SECTION V

STATISTICAL AND FACTUAL STUDIES

Following Congressional enactment which permitted the expenditure for fact-finding studies related to highway problems of an amount not to exceed $1\frac{1}{2}$ per cent of the Federal funds appropriated for highway construction, the Public Roads Administration proposed to the highway departments of the several states that they each undertake such studies in cooperation with and correlated by the administration.

Purpose of Studies

The primary purpose of the proposed studies was to develop information that would aid each state to evaluate its present highway system, to determine its needs for future improvement, and to develop a long range plan commensurate with its needs and income. In addition, definite information obtained regarding motor user imposts and the variety and extent of use to which the various highway systems are subjected would provide facts on which to base equitable taxation and regulation of motor vehicles as well as a measure for the allocation of road construction funds.

Organization

The Arkansas State-wide Highway Planning Survey was established in 1936 as a joint undertaking of the Highway Department and the Public Roads Administration for the purpose of making the studies suggested. Executive personnel were transferred from the regular highway department staff and additional employees were engaged as required. The Work Projects Administration provided and paid a number of clerical workers.

In May, 1939, the Division of Statistics and Analyses was set up to collect and prepare statistical data for the use of the Department and of the State government as well as to complete the basic studies of the Planning Survey, to revise the various classes of data initially collected, keeping them currently useful, and to make such additional studies as might be found essential to intelligent planning of a highway program.

Accomplishments

Road Inventory—Knowledge of the present physical condition of the property is essential in planning future improvements, hence an inventory was made showing the length, width, type of surface, condition and other pertinent facts relative to all roads in the State. Houses, business establishments, schools, churches and other features indicating the origin and destination of traffic were recorded. All these data have been posted on a series of State and county maps which have been published and widely circulated. The pertinent facts have been analyzed and listed in a number of tabulations which are on file at the Highway Department.

Traffic Studies—The necessity for improvement, the economical type and width of surface to be used and the order of priority cannot be equitably determined without a knowledge of the volume and type of traffic passing over the roads. To provide this data, a state-wide traffic survey was made in 1939 during which the volume of traffic was counted at 12,000 road intersections throughout the State. Fifteen automatic traffic recorders kept continuous records and manual counts were made at over two hundred key stations at regular intervals throughout the year in order to determine the daily, weekly and monthly variation in all localities. In addition, trucks were stopped, weighed and measured and pertinent data regarding their operations obtained from the drivers at 36 stations on the principal highways. This information is now being analyzed and will be published in 1940.

Although the data from this study are not at this time in completed form for final analysis, sufficient information has been made available so that comparisons may be

made between the present traffic volume and that which occurred during previous

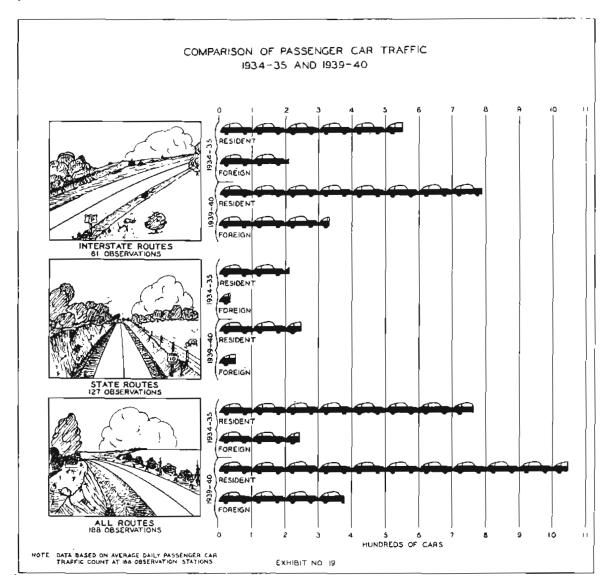

years over various state and inter-state routes.

The following tabulation indicates the average increase of traffic as determined from counts made at 188 points during the period 1934-35 and again during the period 1939-40.

Comparison of Average Daily Traffic

		Interstate Ro	utes		State Routes			All Routes	
Vehicle Type	1934-1935	1939-1940	Increase	1934-1935	1989-1940	Increase	1934-1935	1939-1940	Increase
	Vehicles	Vehicles	Per Cent	Vehicles	Vehicles	Per Cent	Vehicles	Vehicles	Per Cent
Passenger-Local	550	795	44.5	209	251	20.1	759	1.046	37 8
Passenger-Foreign.	206	336	63.1	39	50	28,2	245	386	57.6
				_					
Passenger-Total .	756	1.131	49.6	248	301	21.4	1,004	1,432	42.6
Truck	. 166	377	127.1	69	134	94.2	235	511	217.4
Bus	9	19	111.1	3	6	100.0	12	25	108.3
				_		_			
Total	. 931	1,527	64.0	320	441	37.8	1,251	1,968	57 3

It will be noted that the average traffic increase for passenger cars is only 42.6 per cent as compared with an increase for trucks of 117.4 per cent and for busses of 108.3 per cent. These disproportionate increases are due in part to the relative increases in

registration; passenger vehicle registration increased 8.5 per cent from 1935 to 1939 while truck registration gained 53.7 per cent and the number of busses jumped 121.6 per cent. Exhibit No. 19 shows the increase in passenger car traffic during the five-year period, 1935-1940.

Road Use and Motor Vehicle Allocation—A knowledge of the geographical distribution of motor vehicles, the annual travel, the relative use of different highway systems and the fees and taxes paid by vehicle owners is a prerequisite to the establishment of an equitable allocation of funds to the various highway systems as well as an essential to the preparation of impartial tax laws. The Division of Statistics and Analyses has published two reports which present these data, namely, "Motor Vehicle Allocation and Road Use Surveys of the State of Arkansas" and "Analyses of Motor Vehicle Registrations for 1937-1938." An analysis of the 1939 motor vehicle registrations has been made and will be published in the near future.

Financial Study—The "Fiscal Survey of Arkansas" recently published by this division contains a general discussion and a large number of tables which present an analysis of the income and expenditures of all governmental agencies within the State for all purposes but with particular reference to highways.

The gradual transition which has removed the highway tax burden from the land owner to the motor vehicle user and the general trend to increased governmental activities and augmented expenditures by all agencies presents a complicated problem to the highway planner which requires a knowledge of all the financial operations within the State. Much of the information required for this study is contained in this report. Supplementing this are the facts presented in another report, "Expenditures for Highway Purposes in Arkansas 1917-1937."

Road Life—In order to present a comprehensive picture of highway conditions it is necessary to show the cost of our highways, their present worth, and the approximate date when they will be worn out or become obsolete. The Road Life Study was initiated as a basis for determining the probable life of the various types of road surfaces and bridge structures. Density of traffic, increased speed and loadings have resulted in a more rapid rate of deterioration of highway facilities and it is believed the data assembled for this study in which all of these factors are considered will permit the construction of life expectancy tables that will conform more accurately to present highway use. With the completion of this study records will be available indicating the relative value of the various types of road surfaces now in use, and an estimated cost of maintenance and replacement.

Statistical Data—The Public Roads Administration requires from each state monthly and annual reports on motor vehicle registration, gasoline consumption, motor users imposts, highway income and expenditures, additions and improvements to the highway system, county road improvements and expenditures as well as many special reports. In addition to these reports, the Division of Statistics and Analyses prepares a number of charts and tabulations for the use of Highway Departmental and other State officials and supplies a large variety of statistical information upon request.

Tables and Charts—The appended tables and charts present some interesting comparisons and indicate some of the data collected and information disseminated by the Division of Statistics and Analyses.

Table 6—Total expenditures for highway purposes by counties from April 1, 1917 to December 1, 1937.

Table 7—Summary of expenditures of highway purposes in Arkansas from April 1, 1917 to December 1, 1939.

The above tables are taken from the "Review of Highway Expenditures in Arkansas" and indicate the expenditure by county and the spending agency. Table 7 has been revised to include 1938 and 1939 disbursements.

Exhibit 20—Seasonal variation in Traffic 1939-40 is based upon information obtained by automatic traffic recorders for corresponding periods in 1939 and 1940.

Exhibit 21—Distribution of car and truck registrations by year model and population group, 1939. This information was obtained from the analysis of motor vehicle

registration for the year 1939, and indicates the relative age distribution and the location of motor vehicles, respectively.

Exhibit 22—Motor vehicle registrations and motor fuel consumption. This exhibit indicates the relative annual motor vehicle registration and gasoline consumption from 1924 through 1939.

Exhibit 23—Comparative Arkansas and national motor fuel consumption and motor fuel tax earnings. This information is kept current by this Division and is useful in forecasting and checking the trend of motor fuel tax income.

Exhibit 24—Comparative Arkansas and national motor vehicle registrations and receipts. These data serve the same purpose as those listed above.

COMPARATIVE ARKANSAS AND NATIONAL MOTOR VEHICLE REGISTRATION RECEIPTS INCLUDES TRAILERS AND MOTORCYCLES

SECTION VI APPENDIX

In order to maintain continuity, the number of tables included in the preceding Sections has been held to the minimum. All statistical tabulations have been grouped in the order of subject matter and included in this Section of the report for ready reference. The numbering of Tables has been kept in sequence throughout the publication in order to facilitate reference in the text and avoid confusion. A brief review of highway legislation in Arkansas has also been included in this Section.

LIST OF TABLES

- 8 Schedule of Balances, Receipts and Disbursements by Funds, Biennial Period Ending June 30, 1940.
- 9 Summary of Unapportioned Funds for Biennial Period Ending June 30, 1940.
- 10 Net Revenue From Motor User Imposts, Biennium Ending June 30, 1940.
- Net Returns to Counties From Motor Fuel Tax. Biennial Period Ending June 30, 1940.
- 12 Aids, Grants and Shared Taxes to Local Units from State Highway Revenues, Biennial Period Ending June 30, 1940.
- Maintenance Expenditures—Summary of Expenditures for Highway Maintenance and Betterment, Biennial Period Ending June 30, 1940.
- Schedule of Expenditures from Special Highway Improvement Fund Created by Act 12 of 1938 for Biennium Ending June 30, 1940.
- Analysis of Expenditures for Signs and Guard Posts by Districts, Biennial Period Ending June 30, 1940.
- 16 Classification of Highway Maintenance Expenditures July 1, 1939, to June 30, 1940.
- Net Revenue to Highway Fund from Motor Fuel Tax and Average Net Income Per Motor Vehicle Derived from Motor Vehicle Registration Fees and Motor Fuel Tax, 1934 to 1940.
- 18 Analysis of State Highway Expenditures by States—1938.
- Total Debt Service Requirements from State Highway Fund Under Provisions of Act No. 11 of 1934.
- 20 Record of Road and Bridge Contracts Awarded.
- Tabulation of Road Mileage by Types Listed by Counties—Assembled by Congressional Districts.
- 22 Distribution of Construction Funds by Congressional Districts.
- 23 Distribution of Construction Costs by Routes.
- 24 Motor Vehicle Traffic Accidents by Type of Vehicle.
- 25 Motor Vehicle Traffic Accidents by Type of Accident.
- 26 Motor Vehicle Traffic Accidents by Time of Accident.
- 27 Motor Vehicle Traffic Accidents by Day of Week.
- 28 Motor Vehicle Traffic Accidents by Type of Surface.
- 29 Motor Vehicle Traffic Accidents by Condition of Motor Vehicle.
- Review of Highway Legislation in Arkansas.

A REVIEW OF HIGHWAY LEGISLATION IN ARKANSAS DURING THE BIENNIUM ACTS OF 1939

- Act No. 4, Official Inspections—Repeals Section 133, 134, 135, 136, 137, and 138 of Article XV of Act 300—1937 requiring official inspection of motor vehicles.
- Act No. 32, Roads Outside Highway System—With the approval of the County Court the Commissioners in each road improvement district whose roads are not wholly included in the State highway system may levy a tax not to exceed 1% of the assessed benefits for the construction, repair and maintenance of such roads, and may sell certificates of indebtedness for the same purpose.
- Act No. 45, Mississippi River Parkway—This act enables the State to avail itself of an act of the U.S. Congress authorizing a survey for a National Mississippi River Parkway from its source to its mouth.
- Act No. 65, Des Arc Toll Bridge—Requires the State Highway Department to acquire the toll bridge at Des Arc.
- Act No. 72, Operators Licenses—Amends Sec. 18, Act 280—1937. Fixes fee for operators licenses at fifty cents, money to be used for enforcing State traffic laws.
- Act No. 104, Bridge Bond—Makes appropriations for the payment of maturing bonds and interest of bridge improvement districts, money to be transferred to the Bridge Bond Retirement Fund from the State Highway Refunding Bond Redemption Account in the State Highway Fund. (See Act No. 330).
- Act No. 128, Destruction of Highway Signs—Amends Section 35, Act 300—1937, and fixes fines of \$10 to \$500 and/or imprisonment up to six months as punishment for anyone found guilty of defacing or destroying official highway signs.
- Act No. 133, Bridge at Black Rock—Directs the State Highway Commission to construct a bridge across the Black River at Black Rock and to construct a State Highway thereto.
- Act No. 160, Road to Crowley Ridge Park—Authorizes State Highway Commission, at its discretion, to add a road to the State Highway system, from Marianna to Crowley Ridge Park.
- Act No. 174, Road at Index—This act appropriates surplus funds in the hands of Red River Bridge District for the paving of Highway No. 71 from Odgen to the bridge at Index, Arkansas.
- Act No. 179, Speed Limit—Fixes speed limit on State Highway at 60 miles per hour for passenger cars and limits ranging from 35 to 55 miles per hour for various types of trucks and busses.
- Act No. 191, Time for Collection of License Fees—Time for collecting motor vehicle license tax for the year 1940 and each year thereafter shall be from November 1, to December 31. Governor may extend time to January 30.
- Act N. 276, Purchase of Toll Bridges—Appropriates \$120,000.00 for the purchase of all privately owned toll bridges in the State or for the construction of bridges where such privately owned toll bridges cannot be purchased.
- Act No. 330, Bridge Improvement District Bonds—Amends Act 9 of the Extraordinary Session of the Fifty-First General Assembly and provides for the payment of the maturing bonds and interest of bridge improvement districts with appropriations to the Commissioners of such districts from the Bridge Bond Retirement Fund.
- Act No. 338, Projects off Highway System—Provides for the protection and maintenance of highway projects off the State Highway System, constructed by special agreement with the State Highway Commission using U. S. Government funds. Money from County Turnback Fund to be turned over to Highway Department for such maintenance when county violates its agreement.

Act No. 340, Load Limit—Amends Act 300, 1937, and establishes a formula for determining load limits for trucks.

Act No. 359, Maintenance on Detours—Permits the State Highway Department to do maintenance work where they desire to do so on a road where traffic has been for the past several years frequently diverted over the road due to the impassable condition of the State Highway owing to temporary flood.

Act No. 383, Border Bridges—Authorizes the State Highway Commission to maintain in whole or in part a toll highway bridge or bridges across rivers and waters bordering the State of Arkansas as a part of the State Highway System.

DEVELOPMENT OF HIGHWAY LEGISLATION IN ARKANSAS

STATE HIGHWAY COMMISSION

Act 302, 1913—The first organization of a State Highway Department was effected through augmenting the State Land Office into a Department of State Lands, Highways and Improvements. A three-member State Highway Commission was created with an elected Commissioner of State Lands, Highways and Improvements as chairman and full time executive, the other members to be appointed by the governor for over-lapping two-year terms.

Act 105, 1917—An Advisory Board of three members was created to recommend to the Commission the apportionment of State and Federal Funds.

Act 5, Special Session, 1923—The commission personnel increased to five members, one member from each agricultural school district to be appointed by the Governor for four-year overlapping terms. Highway Department given full control over all construction and maintenance of State Highways.

Act 65, 1929—State Highway Department separated from State Land Office. Fifth member of Commission also to be appointed by Governor. Chairman-executive to be elected by Commission. Ten-year overlapping terms.

Act 3, 1933—New Commission of five members to be appointed by Governor from state at large. Four-year terms. Commission to elect chairman to preside at meetings and to appoint a Director to be chief executive officer of the department.

Acts 318-328, 1935—Governor to appoint Commission of seven members, one from each Congressional District, for two-year terms. Also to appoint a Director as executive officer of the department.

STATE HIGHWAY SYSTEM

Act 105, 1917—Designated all public roads in state, except streets in cities of first and second class, as State Roads and eligible to receive Federal Aid.

Act 5, Special Session, 1923—Created State Highway System of 6700 miles of Primary and Secondary Federal Aid Roads and Connecting State Highways. Commission empowered to make changes and additions, but with no authority to remove routings previously designated.

Act 65, 1929—State Highways declared to be the roads heretofore designated by the Highway Commission as shown by a map on file in the offices of the State Highway Commission. The system included 8,582 miles at this time.

STATE HIGHWAY BONDS

Acts 11 and 80, 1927—Provided that that the State should borrow each year by means of State Highway notes whatever amount may be necessary, not to exceed \$13,000,000.00 in addition to funds derived from automobile licenses, gasoline taxes, and Federal Aid to pay the annual maturities and interest on outstanding road improvement district bonds and "for each of the years 1927, 1928, 1929 and 1930 allot for new construction a sum equal to twice the aggregate amounts alloted to road districts and for each year thereafter, until the road system of the state is brought to a parity shall allot as a minimum a sum at least equal to the aggregate amount alloted to road districts." Pledges revenues from automobile license fees and gasoline tax to secure payment.

Act 6, Special Session, 1928—Increased the limit of amount which could be borrowed in any calendar year to \$18,000,000.

Act 15, Special Session, 1932—Authorized issuance of Revenue Bonds in exchange for Road Improvement District Bonds. Pledged Highway Revenues and established

order in which all highway income should be disbursed. Provided for issuance of short term notes in lieu of vouchers or warrants due or outstanding.

Act 167, 1933—Authorized the issuance of State Bonds to refund all outstanding Highway obligations and created a Refunding Board.

Act 11, Special Session, 1984—Provided for issuance of State Highway Refunding Bonds to exchange for outstanding Highway Bonds and Notes, Toll Bridge Bonds, Road Improvement District Bonds and for issuance of Refunding Certificates of Indebtedness to aid Municipal Improvement Districts. Created a new Refunding Board.

TOLL BRIDGES AND TOLL BRIDGE BONDS

Act 104, 1927—Authorized State Highway Commission to construct and operate toll bridges on the State Highway System. Provided that the Commission might issue State Highway Bridge Bonds to raise funds for construction of each individual bridge secured by a mortgage on that bridge and a pledge of tolls collected.

Acts 71, 76, 191, 233, 1927—Made similar provisions for bridges at designated sites.

Acts 4, 7, Special Session, 1928—Provided for conversion of bridges built by Improvement Districts into Toll Bridges. Prohibited granting of franchises for private toll bridges.

Act 5, Special Session, 1928—Authorized State Highway Commission to construct and operate toll bridges on State Highway System. Provided that Commission should issue State Toll Bridge Bonds and for the creation of a State Toll Bridge Fund. Pledged net revenue from toll bridges, supplemented if necessary with gasoline tax and automobile licenses. Did not repeal Act 104 of 1927.

STATE AND COUNTY HIGHWAY FUNDS

(See Motor Vehicle and Gasoline Taxes for Direct Division of Proceeds)

Act 302, 1913—Highway Improvement Fund created. All land office fees and State's share of proceeds from motor vehicle registrations to be credited to this fund.

Act 5, Special Session 1923—State Highway Fund Created. All fees from State Land Office, all motor vehicle registration fees, gasoline taxes and interest on highway funds to be credited. \$3,000,000 annually apportioned to counties, divided in varying ratios between County Highway Funds and Road Improvements Districts.

Act 11, 1927—All highway income including that derived from sale of bonds credited to State Highway Fund. Approximately \$1,500,000 apportioned to counties for County Highway Improvement Funds.

Act 3, Special Session, 1928-\$565,000 additional apportioned to counties for that year.

Act 63, 184, 1931—Amended Act 65, 1929. Provided that 1-6 of the proceeds from the tax on gasoline and $12\frac{1}{2}\%$ of the proceeds from the sale of State Highway notes or bonds be credited to the County Highway Fund and transferred \$1,875,000 to that fund from the State Highway Fund.

Act 11, Special Session, 1934—Created a new State Highway Fund to which balances in several old funds were transferred. Provided that the State's share of gasoline taxes, all motor vehicle fees, all toll bridge and miscellaneous fees be credited to this fund. Established priority in annual charges on this fund (a) 25% for highway maintenance, (b) \$100,000 for toll bridge maintenance, \$4,800 to General Revenue, and \$11,500 to State Auditorial Funds, (c) sufficient to pay interest on refunding bonds, (d) balance to purchase bond tenders.

Act 12, Special Session 1938—Created a Special Highway Improvement Fund, to which was transferred some unused balances from other funds, all oil inspection fees hereafter collected, and the \$16,300 from General Revenue and State Auditorial Funds, and the balance of the \$100,000 fund not used for toll bridge maintenance as provided by Act 11, 1934.

MOTOR VEHICLE FEES AND GASOLINE TAXES

- Act 134, 1911—Motor vehicle first recognized and defined in Arkansas. Provided for registration of all motor vehicles with Secretary of State and payment of a uniform fee of \$5.00. Proceeds to General Revenue Fund.
- Act 302, 1913—Registration fees raised to \$10.00. Provided for collection by Sheriffs. Half of proceeds to be retained by County, and half paid into Highway Improvement Fund. Highway Department required to issue tags and keep registration records.
- Act 105, 1917—Provided that all proceeds from motor vehicle registration fees be paid into Highway Improvement Fund.
- Act 494, 1921—Motor Vehicle Registration fees fixed on horsepower and weight basis. Proceeds divided 70% to counties, 30% to Highway Improvement Fund.
- Act 606, 1921—First Tax on Gasoline. One cent per gallon on retail sales of gasoline and kerosene collected by county treasurers. Proceeds divided 50% to counties, 50% to Highway Improvement Fund.
- Act 501, 1923—Repealed Act 606, 1921. Provided for tax of three cents per gallon on gasoline payable to the Auditor of State by manufacturers and wholesalers. Proceeds divided 75% to counties and 25 per cent to State Highway Improvement Fund.
- Act 5, Special Session 1923—Motor Vehicle license fees increased, gasoline tax increased to 4c per gallon, and a tax of 10c per gallon imposed on motor oil. All proceeds paid to State Highway Fund.
- Act 240, 1927—Gasoline tax increased to 5c per gallon. Tax on motor oil repealed. Proceeds paid to State Highway Fund.
 - Act 65, 1929-Provided for collection of gasoline tax by Revenue Department.
- Act 63, 1931—Gasoline tax increased to 6c per gallon. Proceeds divided 1/6 to County Highway Fund and 5/6 to State Highway Fund.
- Acts 6, 36, 1933—All motor vehicle license fees radically reduced and provision made for additional reduction on automobiles over four years old.
- Acts 9, 94, 1933—Supervision of Registration of Motor Vehicles transferred from Highway Department to Revenue Department and Commissioner of Revenue empowered to collect motor vehicle license fees.
- Act 11, Special Session, 1934—Gasoline tax increased to 6½c per gallon. Proceeds divided 7.7% to County Highway Fund 92.3% to State Highway Fund.
- Act 9, Special Session, 1938—Increased intransit registration fee and placed revenue therefrom in Bridge Bond Retirement Fund.
- Act 11, Special Session 1938—Additional amount of 1/4c per gallon from gasoline tax alloted to County Highway Fund.
- Act 13, Special Session, 1938—Provided that formula for computing license fees on motor trucks and trailers be based solely on capacity as designated by manufacturer.
- Act 71, 1929—Act 5, Special Session of 1928 amended to authorize State Highway Commission to purchase and acquire privately owned toll bridges.
- Act 9 1933—Transferred all duties in reference to control and collection of tolls from Highway Department to Revenue Department.
- Act 11, First Special Session, 1934—Provided for issuance of State Toll Bridge Refunding Bonds.
 - Act 11, Special Session, 1938—Declared all State-owned bridges toll fee.

ROAD IMPROVEMENT DISTRICTS

- Act 302, 1913—Provided for creation of road improvement districts by legislature.
- Act 338, 1915—Provided for formation of districts by property owners. Bond issues limited to 30% of assessed valuation. Popularly known as the Alexander Law.
 - 1918-457 Special Acts creating road districts.
 - 1921-5 districts created. 53 repealed.
- Act 5, Special Session, 1923—Provided for the distribution of \$3,000,00 annually to counties to aid in paying bonds and in new construction. Highway Department must supervise all construction where state or federal aid is applied. Tax on property limited to 50% of construction cost. Popularly known as Harrelson Law.
- Act 11, 1927—Provided that beginning in 1927 the Highway Commission shall allot annually to each road improvement district then having outstanding bonds, an amount sufficient to pay the bonds and interest maturing that year—popularly known as the Martineau Law.
- Act 112, 1927—Provided for collection of delinquent taxes, payment of debts, redemption of lands and disposition of funds in above districts.
- Act 239, 1927—Provided that districts heretofore created by Legislature might proceed with construction of roads not on highway system.
- Act 63, 1931—Provided that the State Treasurer should deduct from the turn-back annually due any county the amount required to pay 75% of maturing bonds and interest issued by Road Improvement Districts, since February 4, 1927, and 50% of maturing bonds and interest issued subsequent to passage of this act.
- Act 11, Special Session, 1934—Provided for issuance of Road District Refunding Bonds in exchange for outstanding valid road improvement district bonds, and for the retention of the road district bonds in trust, uncancelled, by the Treasurer of State as collateral for the refunding bond.
- Act 23, 1938—Provided for creation of improvement districts to acquire right-ofway for highway viaducts or overpasses.
- Act 325, 1939—Provides for payment during the biennial period of maturing principal and interest of Road Improvement District bonds issued since February 4, 1927, for the purpose of building farm-to-market roads.

MUNICIPAL STREET IMPROVEMENT DISTRICTS

Continuation of State Highways

- Act 184, 1927—Provided for aid in construction of continuations of State Highways through Cities.
- Act 8, 1928 Special Session—Amended Act 184 of 1927 to provide for payment from State Highway Funds of one-half of the cost of construction of future improvements of continuations of State Highways through towns and cities.
- Act 85, 1931—Provided for payment of 50% of the outstanding bonds and interest representing cost of improving continuations of State Highways through towns and cities.
- Act 248, 1931—Amended Act 8 of Special Session of 1928 to provide for payment of entire unmatured bond issue of any municipal street improvement district having a route and street thereon on the designated State Highway System where the work was done subsequent to June 9, 1927.
- Act 11, Special Session, 1934—Provided for issuance of refunding certificates of indebtedness to all municipal street improvement districts in amount equal to the actual cost of improving streets which were, at the time of the passage of the act, continuations of a State highway through the town.

Act 22, Special Session, 1938—Amended Section 7279 of Pope's Digest to include provision for formation of improvement districts for the purpose of acquiring right-of-way and payment of property damages when work of construction is done by the U.S. Government.

BRIDGE IMPROVEMENT DISTRICTS

Act 9, Special Session, 1938—Provides a registration fee for motor vehicles in transit from manufacturer to dealer or from dealer to dealer, the revenue so derived to be placed in a Bridge Bond Retirement Fund. The receipts are to be apportioned annually to improvement districts that have issued bonds for the construction of bridges forming an integral part of the State Highway System.

Act 10, Special Session, 1938—Provides for the relief of the debt service of bridge improvement districts through the payment by the state of maturities and interest due for the year 1938 on obligations incurred through the construction of bridges on the State Highway System.

Act 330, 1939—Amends Act No. 9, 1939, to apply to all bridge improvement districts. Provides for transfer of funds from the State Highway Refunding Bond Redemption Account to supplement intransit fees.
